# Universal Serial Bus Communications Class Subclass Specification for Mobile Broadband Interface Model

(developed pursuant to USB-IF IP Agreement for Network Control Model Rev 1.0 and subsequently renamed as above)

Revision 1.0

November 14, 2011

# **Revision History**

Rev	Date	Filename	Comments
1.0	2011-10-25	MBIM v1.0	Initial release  This specification was developed as USB Communications Class Subclass Specifications for Network Control Model (NCM) Devices v2.0 and subsequently renamed as Mobile Broadband Interface Model (MBIM) v1.0

# 1 **OVERVIEW**

This specification is a protocol by which USB hosts and Mobile Broadband devices can efficiently exchange control commands and data frames.

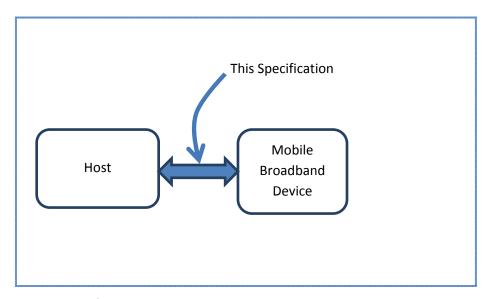

Figure 1: Specification scope

The Mobile Broadband Interface Model (MBIM) is based on the Communications Class Network Control Model (NCM 1.0) Subclass.

MBIM extends the NCM as a protocol between host and USB devices. USB devices referred in this specification are defined as capable of transmitting packet data ("IP" – Internet Protocol) over the cellular technology standards defined by 3GPP or 3GPP2.

This specification defines control commands, raw IP usage and Communications Device Class subclass specification for Network Control Model [USBNCM10] for multiple IP packet aggregations into a single USB transfer.

#### 1.1 TERMS AND ABBREVIATIONS

**Table 1-1: Terms and Abbreviations** 

AKA	Authentication and Key Agreement
APN	Access Point Name

	Mobile Broadband Interface Model	
14		November 14 2011

CDC	Communications Devices Class specification [USBCDC12]	
CID	Command Identifier	
Downlink	Direction from mobile network towards the function	
DSS	Device Service Stream	
ECM	Ethernet Control Model (ECM) [USBECM12]	
IAD	Interface Association Descriptor	
IMSI	International Mobile Subscriber Identity	
HLR	Home Location Register	
МВ	Mobile Broadband	
МВІМ	Mobile Broadband Interface Model. [Formerly called NCM 2.0.]	

MNO	Mobile Network Operator	
	One essential characteristic that defines an MNO is that it must have acquired a radio spectrum license from the government before it can offer mobile phone service within a country. The precise spectrum obtained depends on the type of mobile phone technology the operator intends to deploy.	
MSB	Most Significant Bit (e.g., in a field)	
Multi-mode	Applied to a function or to a device that has both GSM and CDMA capabilities	
MVNO	Mobile Virtual Network Operator	
	Provides the same kind of services as an MNO but are dependent on an MNO to provide the radio network.	
NA	Not applicable	
NCM or NCM 1.0	Network Control Mode [USBNCM10]	
NCM/MBIM function	A function that supports both NCM 1.0 and MBIM operation modes, as described in section 3.2.	

Mobile Broadband Interface Model	

ОТА	Over-the-air	
PDU	Protocol Data Unit	
PLMN	Public land mobile network	
PPL	Preferred provider list	
PRL	Preferred roaming list	
Provider	Also known as MNO and MVNO	
RSSI	Received signal strength indication	
R-UIM	Removable User Identity Module	
	A card developed for CDMA handsets, equivalent to the GSM SIM card. Sometimes referred to as U-RIM.	
SC	Service Center	
SMS	Short Message Service	
SMSC	Short Message Service Center	
STK	SIM Application Toolkit	
STK PAC	STK Proactive Command	

# Mobile Broadband Interface Model

Transaction	A message sent by the host and the corresponding response from the function.
Uplink	Direction from the function towards the mobile network
USB	Universal Serial Bus
USSD	Unstructured Supplementary Service Data
U-RIM	See R-UIM
VLR	Visitor Location Register

This specification defines the 1.0 version of MBIM. 'NCM' is used interchangeably with 'NCM 1.0'.

#### 1.2 SCOPE

This document specifies a new control and data plane for mobile broadband based networking devices, as a subclass based on the Universal Serial Bus Class Definitions for Communications Devices specification [USBCDC12]. This specification defines the following material applicable to MBIM functions:

- The class-specific contents of standard descriptors.
- Additional class-specific descriptors.
- Required interface and endpoint structure.
- Class-specific commands.
- Class-specific notifications or events.
- The format of data that is exchanged between device and host.
- The required operational behavior.

Behavior that is required of all USB devices and hosts is defined by [USB20] and [USB30]. Behavior that is required of all Communications devices is defined by [USBCDC12]. Some commands and notifications may be based on material defined in [USBNCM10].

	Mobile Broadband Interface Model	
18		November 14, 2011

This specification imposes requirements on devices not on hosts. Accordingly, normative language throughout (see section 1.4) applies strictly to devices and not to hosts.

#### 1.3 OTHER USB NETWORKING SPECIFICATIONS

At time of writing, four other USB networking subclasses were defined:

- Ethernet Control Model (ECM) [USBECM12]
- Ethernet Emulation Model (EEM) [USBEEM10]
- ATM Networking Control Model [USBATM12]
- CDC NCM Subclass Revision [USBNCM10]

ECM and NCM are both applicable to IEEE 802.3 type Ethernet networking functions that can carry IP traffic to an external network. ECM was designed for USB full speed devices, especially to support DOCSIS 1.0 Cable Modems. Although ECM is functionally complete, it does not scale well in throughput or efficiency to higher USB speeds and higher network speeds. NCM draws on the experience gained from ECM implementations, and adjusts the data transfer protocol to make it substantially more efficient. EEM is intended for use in communicating with devices, using Ethernet frames as the next layer of transport. It is not intended for use with routing or Internet connectivity devices, although this use is not prohibited. [USBATM12] is applicable to USB-connected devices like ADSL modems which expose ATM traffic directly. Rather than transporting Ethernet frames, [USBATM12] functions send and receive traffic that is broken up into ATM cells and encoded using AAL-2, AAL-4 or AAL-5. Although some of the insights that led to the design of NCM came from experience with [USBATM12] implementations, the two specifications address substantially different target applications.

Although NCM was targeted for high-speed network attachments like HSPA and LTE, it lacks the definition of control commands and has packet (dis)assembly overhead to carry the raw IP encapsulated in an Ethernet frame. Primarily, NCM is based on 802.3 frames which doesn't apply to mobile broadband devices covered in this specification (there are no MAC addresses nor meaning to the fields in an Ethernet frame).

MBIM addresses these shortcomings in NCM.

#### 1.4 EDITORIAL NOTES

In this specification, the words 'shall' and 'must' are used for mandatory requirements, the word 'should' is used to express recommendations and the word 'may' is used for options.

In some cases, text from [USBNCM10] is repeated or referred to for clarity. In such cases, the MBIM specification shall be treated as the controlling document.

# 3 **COMPATIBILITY WITH NCM 1.0**

#### 3.1 SUMMARY OF DIFFERENCES BETWEEN MBIM AND NCM 1.0

The largest deviation from NCM 1.0 [USBNCM10] is that devices transfer raw IP packets instead of packets with 802.3 headers. The Identification of raw IP packets is described in section 7.1 on Data formatting. The following table shows the changes for the class-specific request that is reused from [USBNCM10].

Table 3-1: NCM 1.0 request applicability to MBIM devices

Request	Changes from NCM 1.0	Comment
SendEncapsulatedCommand	Yes	Required for MBIM functions
GetEncapsulatedResponse	Yes	Required for MBIM functions
GetNtbParameters	No	
GetNtbFormat	No	
SetNtbFormat	No	
GetNtbInputSize	No	
SetNtbInputSize	No	
GetMaxDatagramSize	No	
SetMaxDatagramSize	No	

#### 3.2 IMPLEMENTING FUNCTIONS THAT SUPPORT NCM 1.0 AND MBIM

For backwards compatibility, a device vendor may need to build a device that will work with hosts that support only NCM 1.0, and with hosts that support MBIM. Although a complete list of approaches is beyond the scope of this specification, the following approach is recommended. In the remainder of this section, "shall" or "must" are to be interpreted as conditionally mandatory requirements: if the device implements the recommendation in this section, the device must follow the approach given here, or the approach is not guaranteed to work. In addition, compliance test suites may enforce these requirements as part of their test process, if they detect a device that seems to follow this recommendation.

Mobile Broadband Interface Model

#### 3.2.1 **OVERVIEW**

Functions that implement both NCM 1.0 and MBIM (an "NCM/MBIM function") according to this recommendation shall provide two alternate settings for the Communication Interface. Alternate setting 0, and the associated class and endpoint descriptors, shall be constructed according to the rules given for the Communication Interface in section 5 of [USBNCM10]. Alternate setting 1, and the associated class and endpoint descriptors, shall be constructed according to the rules given in section 6 (USB Device Model) of this specification.

When alternate setting 0 of the Communication Interface is selected, the function shall operate according to the rules given in [USBNCM10]. In particular, NTBs shall transport Ethernet frames, not IP datagrams. When alternate setting 1 of the Communication Interface is selected, the function shall operate according to the rules given in this specification.

For some hosts, devices with NCM 1.0 and MBIM functions may have to implement additional device-level features in order to take maximum advantage of the features built into the host.

#### 3.2.2 **DESCRIPTOR REQUIREMENTS**

#### 3.2.2.1 INTERFACE ASSOCIATION DESCRIPTOR

If an interface association descriptor is used, its interface class, subclass, and protocol codes shall match those given in alternate setting 0 of the Communication Interface.

#### 3.2.2.2 COMMUNICATION INTERFACE ALTERNATE SETTING 0

The function shall have two interface descriptor bundles for the Communication Interface. The first bundle shall start with an interface descriptor. The descriptor shall have bAlternateSetting == 0, bInterfaceClass == 02h, bInterfaceSubClass == 0Dh, and bInterfaceProtocol == 00h.

This descriptor is followed by the required descriptors from section 5.2 of [USBNCM10], and optional descriptors as needed. The collection of descriptors ends with an endpoint descriptor (possibly followed by an endpoint companion descriptor) for the NCM1.0 notification pipe.

#### 3.2.2.3 COMMUNICATION INTERFACE ALTERNATE SETTING 1

After the Communication Interface, but before the first Data Interface alternate setting, the function shall have an additional interface descriptor. bInterfaceNumber for the interface shall be the same as that used in the interface descriptor given in 3.2.2.1 above. bAlternateSetting shall be 01h. The remaining fields of the descriptor shall follow the requirements given in section 6 (USB Device Model) of this specification. In particular, bInterfaceClass shall be 02h, and bInterfaceSubClass and bInterfaceProtocol shall be as specified in Table 6-1: Salient fields of Communication Class Interface Descriptor.

Mobile	Broadband	Interface	Model
IVIODIIC	Dibaubanu	IIIICHACC	IVIOUGI

24 November 14, 2011

This descriptor is followed by the required descriptors (and optional descriptors as needed) from section 6 (USB Device Model) of this specification. The collection of descriptors ends with an endpoint descriptor (possibly followed by an endpoint companion descriptor) for the MBIM notification pipe.

Note that there's no requirement that wMaxPacketSize for the interrupt pipe be the same in alternate setting 1 as in alternate setting 0.

#### 3.2.2.4 DATA CLASS

Functions that implement both NCM 1.0 and MBIM (an "NCM/MBIM function") according to this recommendation shall provide three alternate settings for the Data Class Interface. Accordingly, the data class descriptors shall have three alternate settings. The first two alternate settings shall be formatted as given in [USBNCM10] section 5.3. The third shall be almost identical to the second setting with the sole difference being that the binterfaceProtocol shall be set to 02h.

As for [USBNCM10], the first alternate setting (the default interface setting, alternate setting 0) shall include no endpoints and therefore no networking traffic can be exchanged when the default interface setting is selected. The second and third alternate settings (alternate settings 1 and 2) are used for normal operation, and shall include one bulk IN endpoint and one bulk OUT endpoint.

For Communication Interface setting 0 the only valid settings for the data interface is setting 0 and 1, i.e., [USBNCM10] compatible mode.

For Communication Interface setting 1 the only valid settings for the data interface is setting 0 and 2, i.e., MBIM mode.

For any other combination the result is unknown.

#### 3.2.2.5 FUNCTIONAL DESCRIPTORS FOR NCM AND MBIM FUNCTIONS

Table 3-2: NCM/MBIM Communication Interface Descriptor Requirements

Descriptor	Description	Required/Opt	Order	Reference

				FUNCTIONAL
				DESCRIPTOR

#### 3.2.3 FUNCTION BEHAVIORAL REQUIREMENTS

The overall behavior of the function is determined by the alternate setting currently selected for the Communication Interface. When alternate setting 0 is selected, the function shall operate in NCM1.0 mode. When alternate setting 1 is selected, the function shall operate in MBIM mode.

The effect of changing the Communication Interface alternate setting while the Data Interface is set to a non-zero alternate setting is not specified. Best practice is for the host to ensure that the Data Interface is set to Alternate Setting 0 prior to changing the alternate setting of the Communication Interface.

Regardless of the previous sequence of SET\_INTERFACE commands targeting the Communication Interface, the host is able to put the function into a defined state by the following sequence:

- 1. SET\_INTERFACE(Data Interface, 0)
- 2. SET INTERFACE(Communication Interface, desired alternate setting)
- 3. Sending the required class commands for the targeted alternate setting
- 4. SET\_INTERFACE(Data Interface, 1 if Communication Interface,0 and Data Interface,2 Communication Interface 1)

# 5 FUNCTIONAL CHARACTERISTICS

#### 5.1 OVERVIEW

The MBIM function consists of two logical channels. One is the data channel for transporting payloads, similar to the [USBNCM10] data transport. The only difference is that instead of transporting Ethernet frames, MBIM transports raw IP data streams and Device Service Streams. The other channel is used for the control plane, i.e., for transporting CIDs.

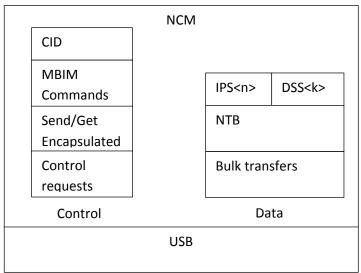

Figure 2: MBIM Logical Layers for Control and Data Channels

#### 5.2 COMMUNICATION PIPES

In addition to the default pipe, each MBIM function shall support one interrupt, one bulk-in and one bulk-out pipe.

#### 5.2.1 **DEFAULT PIPE**

Default-pipe messages are generally used to control a USB device. These messages include standard requests, such as GET\_DESCRIPTOR and SET\_CONFIGURATION. Commands that are sent on the default pipe report information back to the host on the default pipe. If an error occurs, they generate a standard USB error token. This applies to all class-specific requests in addition to the general requests described in the Universal Serial Bus Specification [USB30] .

The class-specific control messages are defined and described in Section 9 of this document.

	Mobile Broadband Interface Model	
28		November 14, 2011

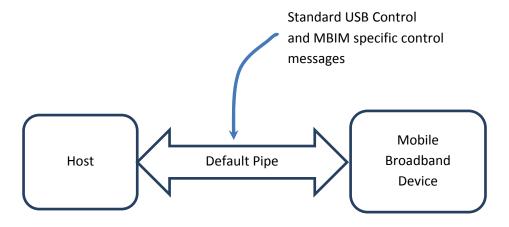

Figure 3: Default Pipe

#### **5.2.2 INTERRUPT PIPE**

Interrupt pipe messages are used to alert the host of an asynchronous event from the device. The event could either be an unsolicited event (see section 9.4.4), or a response to a previously issued class specific control messages (see section 9.4.3),

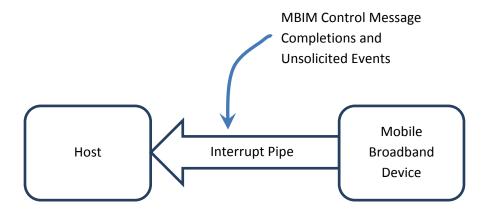

Figure 4: Interrupt Pipe

Mobile Broadband Interface Model

#### 5.2.3 BULK-IN AND BULK-OUT PIPES

The host sends data to the MBIM function using the bulk-OUT pipe. The MBIM function sends data to the host using the bulk-IN pipe.

It is recommended that the values of dwNtbInMaxSize and dwNtbOutMaxSize (which dictate the maximum transfer sizes for the bulk-in and bulk-out pipes, respectively) be multiples of the wMaxPacketSize of the respective bulk pipes. If the transfer in either direction is a less than the configured Max NTB size and is a multiple of the wMaxPacketSize the sender must terminate the transfer with a ZLP. The sender may choose to pad the transfer out max NTB size to avoid the ZLP at its discretion.

#### 5.3 OPERATIONAL MODEL

The MBIM control messages from the host to the device are asynchronous. The host sends a control message to the function on the device's default pipe. The function asynchronously completes the messages and signals availability of the result by sending a notification to the host over the interrupt end-point. The host, then, fetches the response using the default pipe. This model allows the host to issue multiple control messages to the device without waiting for previous message to complete. This flow is show in the figure below.

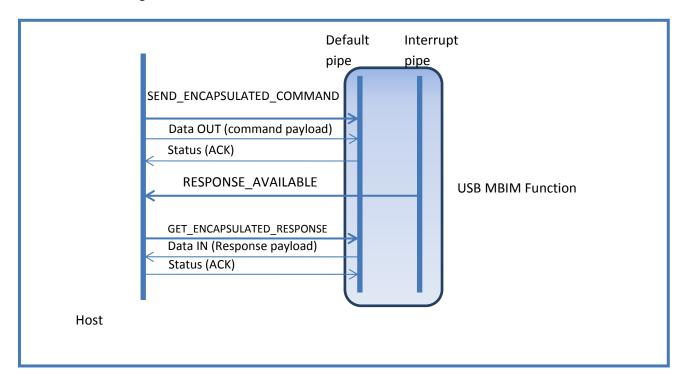

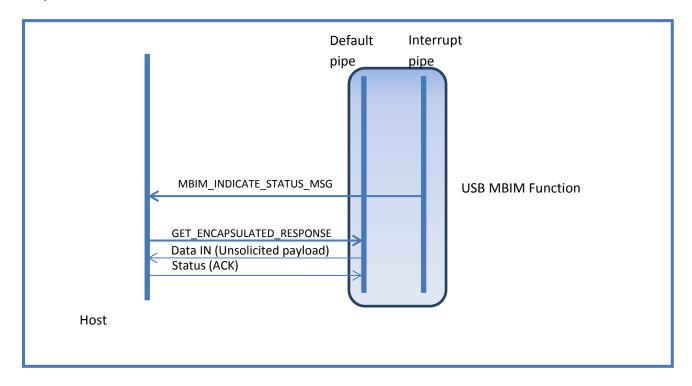

Figure 5: Encapsulated Command Response sequence

	Mobile Broadband Interface Model	
30		November 14, 2011

Similarly, whenever the device needs to notify the host of an unsolicited device events described in section 9.4.4, it uses the interrupt end-point. The host, then, retrieves the information from the control endpoint. This flow is shown below.

**Figure 6: Unsolicited Event Sequence** 

#### 5.4 **DEVICE SERVICE**

A logically group of functionality supported by the device constitutes a "device service." Each device service is uniquely identified by a 128-bit UUID (Universally Unique Identifier). All CIDs exchanged between the host and the device carry the UUID to identify the device service associated with the transfer.

#### 5.4.1 DEVICE SERVICE STREAMS

The transfer of high-bandwidth data over the control channel is not supported. Instead, Device Service Streams over bulk are recommended.

Device Service Stream is a best effort service.

The protocol layer and/or application above MBIM shall be responsible for flow control and recovery from data loss.

Mobile Broadband Interface Model

Doing flow control by throttling the bulk IN/OUT pipes is strongly discouraged, because the pipes are shared by multiple services. Throttling the bulk OUT pipe to benefit one service, for example, may result in deadlock, by preventing delivery of important data to another service.

#### 5.4.2 **CUSTOM DEVICE SERVICES**

Vendors are free to define additional device services by generating a UUID of their own. These services shall not be IP-protocol based.

This mechanism allows vendors to extend the functionality beyond the standard services defined in this document. If a vendor extension changes any of the states in this specification, the function needs to send the necessary indication (section 9.4.4) so that the Host state machine becomes synchronized. See section 10.6 "MBIM Service and CID extensibility" for more information on how to extend the protocol with new device services.

# 6 USB DEVICE MODEL

#### 6.1 **OVERVIEW**

A USB MBIM function is implemented as a USB CDC function with two interfaces. Functions shall provide a CDC Union functional descriptor to group these two interfaces. See [USBWMC11].

A Communication Class interface, with class 02h and subclass 0Eh, and a Data Class interface combine to form a single functional unit representing the USB MBIM device. The Communication Class interface includes a single endpoint for event notification; it also uses the device's default pipe for control messages. The Data Class interface includes two bulk endpoints for data traffic.

There are two ways to group interfaces: the WHCM Union Functional Descriptor (see [USBWMC11]) and the IAD. Devices may also provide an IAD. If an IAD is provided, the information in the IAD for MBIM functions shall be consistent with the information in the CDC Union descriptor and Communication Class interface descriptor.

#### 6.2 STANDARD USB DESCRIPTOR DEFINITIONS

The device returns a USB Device Descriptor per Chapter 9, "USB Device Framework", in the USB Specification [USB20]. See [USBCDC12] or [USBIAD10] for additional details.

#### 6.3 COMMUNICATION CLASS INTERFACE DESCRIPTORS

The MBIM Communication Class interface is described by a USB interface descriptor, functional descriptors for the MBIM subclass, and an endpoint descriptor for the notification endpoint. Table 6-1 defines the salient fields of the Communication Class interface descriptor.

		•		
Offset	Field	Size	Value	Description
5	bInterfaceClass	1	02h	Communication Interface Class code
6	bInterfaceSubClass	1	0Eh	MBIM
7	bInterfaceProtocol	1	00h	MBIM Protocol

Table 6-1: Salient fields of Communication Class Interface Descriptor

MBIM functions must implement class-specific descriptors ("functional descriptors") for the MBIM Communications Interface. The framework for these is defined in [USBCDC12]. MBIM Communications Interfaces must implement the following functional descriptor described in [USBCDC12]:

Mobile Broadband Interface Model

• Header Functional Descriptor (describing the level of compliance to [USBCDC12] Interface and the Data interface).

• Union Functional Descriptor (containing the interface numbers of the Communications Interface and the Data interface).

MBIM functions shall supply an MBIM Functional Descriptor, as defined in Table 6-3: MBIM FUNCTIONAL DESCRIPTOR.

The class-specific descriptors must be followed by an Interrupt IN endpoint descriptor.

Descriptor requirements are summarized in Table 6-2: MBIM Communication Interface Descriptor Requirements. Table 6-2:

**Table 6-2: MBIM Communication Interface Descriptor Requirements** 

Descriptor	Description	Required/Opt	Order	Reference
HEADER	CDC Header	Required	First	[USBCDC12],
	functional			5.2.3.1
	descriptor			
UNION	CDC Union	Required	Arbitrary	[USBCDC12]
	functional			5.2.3.2
	descriptor			
MBIM	MBIM Functional	Required	Arbitrary	Table 6-3: MBIM
	Descriptor			FUNCTIONAL
				DESCRIPTOR

#### 6.4 MBIM FUNCTIONAL DESCRIPTOR

This descriptor provides information about the implementation of the MBIM function. It is mandatory, and must appear after the Header Functional Descriptor.

**Table 6-3: MBIM FUNCTIONAL DESCRIPTOR** 

Offset	Field	Size	Value	Description
0	bFunctionLength	1	12	Size of Descriptor in bytes
1	bDescriptorType	1	Constant	CS_INTERFACE (0x24)
2	bDescriptorSubtype	1	Constant	MBIM Functional Descriptor code (see Table 4-3)

	Mobile Broadband Interface Model	
34		November 14, 2011

3	bcdMBIMVersion	2	Number 0x0100	Release number of this specification in BCD, with implied decimal point between bits 7 and 8. 0x0100 == 1.00 == 1.0. This is a little-endian constant, so the bytes will be 0x00, 0x01.
5	wMaxControlMessage	2	Number	Maximum segment size in bytes a function can handle from a SEND_ENCAPSULATED_COMMAND or can return from a GET_ENCAPSULATED_RESPONSE.  This number must not be smaller than 64. However, in order to avoid frequent fragmentation (e.g., with full SMS or USSD messages), it is recommended that this value be no smaller than 512.
7	bNumberFilters	1	Number	Contains the number of PacketFilters that are available in total for all SessionIds. These filters are potentially capable of causing wake-up of the host.  This number must not be smaller than 16.
8	bMaxFilterSize	1	Number	The maximum size of the PacketFilters in bytes.  This number must not exceed 192.

# Mobile Broadband Interface Model

9	wMaxSegmentSize	2	Number	that the supportion larger that by the ne	ber must not be smaller
11	bmNetworkCapabilities	1	Bitmap	function. that the This is pa Function section 5 specific f D1(NetA	the capabilities of this A bit value of zero indicates capability is not supported. Interned after the NCM all Descriptor [USBNCM10] Interned after that Ethernet-fields D4(CRC) and ddress) are not used.  Reserved (zero) Function can process 8-byte forms of GetNtbInputSize and SetNtbInputSize requests Reserved (zero) Function can process SetMaxDatagramSize and GetMaxDatagramSize requests. Reserved (zero). Reserved (zero) Reserved (zero) Reserved (zero) Reserved (zero)

MBIM departs from NCM1.0 in the specification for wMaxSegmentSize: NCM 1.0 takes it from the Ethernet functional descriptor, whereas MBIM takes it from its own MBIM functional descriptor above (Table 6-3: MBIM FUNCTIONAL DESCRIPTOR). Accordingly, in MBIM the default and minimum value of wMaxSegmentSize is 2048. Furthermore, this is the value of wMaxSegmentSize that applies to both GetMaxDatagramSize and SetMaxDatagramSize in MBIM.

It is important to note that whereas MBIM's bmNetworkCapabilities uses NCM's as a template, the definition in Table 6-3: MBIM FUNCTIONAL DESCRIPTOR is entirely an MBIM construct. Thus, any

	Mobile Broadband Interface Model	
36		November 14, 2011

similarities that may remain between the two have no normative implications. In particular, MBIM's version of bmNetworkCapabilities only uses two bits: D3 and D5. The rest are reserved and set to zero.

#### 6.5 DATA CLASS INTERFACE

The Data Class interface is described by a standard USB Interface Descriptor followed by two endpoint descriptors.

The Data Interface of an MBIM networking function shall have two alternate settings. The first alternate setting (the default interface setting, alternate setting 0) shall include no endpoints and therefore no networking traffic can be exchanged when the default interface setting is selected. The second alternate setting (alternate setting 1) is used for normal operation, and shall include one bulk IN endpoint and one bulk OUT endpoint.

The interface descriptors for alternate settings 0 and 1 shall have binterfaceSubClass set to 0, and binterfaceProtocol set to 02h (see Table 7 of [USBCDC12]).

Table 6-4: Data Class Interface Descriptor Requirements defines the salient fields of the Data Class Interface Descriptor.

**Table 6-4: Data Class Interface Descriptor Requirements** 

Offset	Field	Size	Value	Description
5	bInterfaceClass	1	0Ah	Data Interface Class code
6	bInterfaceSubClass	1	00h	Data Class SubClass code
7	bInterfaceProtocol	1	02h	Data Class Protocol code, Network transfer block-MB

# 7 DATA TRANSPORT

The data packets will be passed to and from the device using the standard NCM 1.0 transfer headers and datagram pointers as described in section 3.2 of [USBNCM10]. Additional considerations are described in section 5.2.3 Bulk-in and bulk-out pipes.

[USBNCM10] defines a method to transport IEEE 802.3 frames between the host and device. For MBIM functions the same method is used but the payload inside the NDP has changed. IEEE 802.3 frames are not supported anymore. Instead "raw" IP (both IPv4 and IPv6) and Device Service Streams are transported between the host and the device without any type of MAC layer header. MBIM devices also introduce the concept of multiple data streams in the NDP packets for both IP and Device Service Streams.

Figure 7: Logical layers for the data transport, shows a logical layering of the data transport mechanisms.

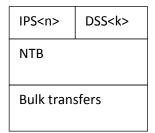

Figure 7: Logical layers for the data transport

In order to identify the frames as containing payload of either raw IP or Device Service Streams, the valid signature values for NDP structures (section 3.3 of [USBNCM10]) are extended as follows.

To distinguish among the data streams, the last character of the dwSignature in the NDP header shall be coded with the index SessionId or DssSessionId specified by the host in the MBIM\_CID\_CONNECT or MBIM\_CID\_DSS\_OPEN command, respectively. The index value is assigned separately for IP and Device Service Streams. The first three symbols are encoded as ASCII characters in little-endian form plus a last byte in HEX (binary) format:

Protocol	NDP16	NDP32	Description
Raw IPv4 or IPv6	"IPS" <sessionid></sessionid>	"ips" <sessionid></sessionid>	Raw IPv4 or IPv6
			payload
Device Service Stream	"DSS" <dsssessionid></dsssessionid>	"dss" <dsssessionid></dsssessionid>	Device Service Stream payload

Because the signature applies to all the datagrams in the NDP, the formats must not be mixed within the NDP, but it can add different NDPs within an NTB (see [USBNCM10]).

	Mobile Broadband Interface Model	
38		November 14, 2011

### 7.1 DATA FORMATTING

The format of the datagrams described by a given NDP depends on the protocol.

#### 7.1.1 IPV4

The datagrams starts with the IPv4 header, and then continues with the appropriate payload.

#### 7.1.2 **IPV6**

The datagrams starts with the IPv6 header, and then continues with the appropriate payload.

#### 7.1.3 DEVICE SERVICE STREAM

The format of the Device Service Stream payload depends on the device service (as identified by the corresponding UUID) that is used when opening the data stream.

#### 7.1.4 MBIM FRAME ALIGNMENT

Many network stacks in embedded devices benefit from careful alignment of the payload to system-defined memory boundaries. MBIM allows a function to align transmitted datagrams on any convenient boundary within the NTB. Functions indicate how they intend to align their transmitted datagrams to the host in the NTB Parameter Structure ([USBNCM10] Table 6-3)

Similarly, for data transmitted from the host, functions indicate their preferred alignment requirements to the host. The host then formats the NTBs to satisfy this constraint.

MBIM assumes that hosts are more flexible and powerful than devices, and that hosts honor the constraints given by the device when preparing OUT NTBs.

Alignment requirements are met by controlling the location of the payload. This alignment is specified by indicating a constraint as a divisor and a remainder. The agent formatting a given NTB aligns the payload of each datagram by inserting padding, such that the offset of each datagram satisfies the constraint:

Offset % wNdpInDivisor == wNdpInPayloadRemainder (for IN datagrams)

Or

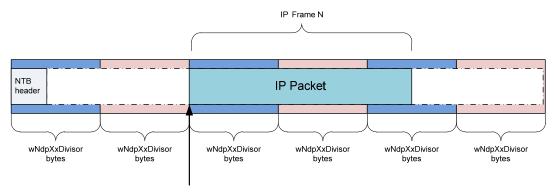

Offset % wNdpOutDivisor == wNdpOutPayloadRemainder (for OUT datagrams)

Two use cases are anticipated (although the specification does not restrict the user to these two cases).

In one use case, the function wants to align the beginning of an IP packet to a cache line boundary. Cache lines are generally much smaller than the maximum IP packet size. In this case, the wNdpXxDivisor is set to the size of a cache line (in bytes), and the wNdpXxPayloadRemainder is set to zero. The effect is shown schematically in Figure 7-8.

#### Mobile Broadband Interface Model

In another use case, the function wants to place each IP packet in a fixed sized buffer. (This is primarily intended for use on the OUT pipe.) For this to work, each buffer must be bigger than the maximum IP packet size. In this case, wNdpXxDivisor is set to the size of the buffer, and wNdpXxPayloadRemainder is set to the desired offset of the IP packet in the fixed size buffer. This situation is shown schematically in Figure 7-9.

Alignment of this point is controlled: in this example, wNdpXxPayloadRemainder is zero, forcing alignment to an integral multiple of wNdpXxDivisor bytes from the start of the block

Figure 7-8: Alignment to a cache line

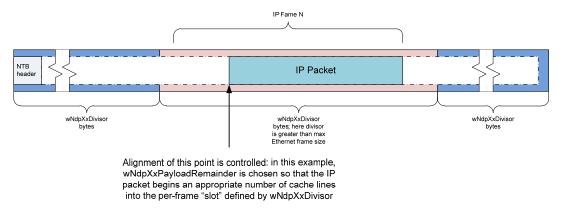

Figure 7-9: Alignment for fixed-size internal buffers

# 8 CONTROL CHANNEL CHARACTERISTICS

The control channel for the MBIM function is the device's default pipe.

MBIM
Commands
Send/Get
Encapsulated
Control
requests

Figure 10: Logical layers for the control channel

## 8.1 CONTROL REQUESTS

The MBIM Interface Class supports class-specific requests, defined in this document and in the communications data class specifications. This section describes the requests that are specific to the MBIM Interface Class. These requests are sent over the default pipe and can apply to different functions as defined by the Communications Class interface codes.

Table 8-1: Networking Control Model Requests lists all of the class-specific requests that are valid for an MBIM Communications Interface. This table includes those defined in [USBECM12] and [USBNCM10]. Commands marked as "required" must be implemented by any conforming MBIM function (see the reference section for each command for details).

**Table 8-1: Networking Control Model Requests** 

Request	Description	Required/Opt	reference
SendEncapsulatedCommand	Issues a command in the format of the supported control protocol.	Required	See 8.1.1 SendEncapsul atedCommand
GetEncapsulatedResponse	Requests a response in the format of the supported control protocol.	Required	See 8.1.2 GetEncapsulat edResponse

Mobile Broadband Interface Model
----------------------------------

Request Description		Required/Opt	reference
GetNtbParameters	Requests the function to report parameters that characterize the Network Control Block	Required	[USBNCM10]
GetNtbFormat	Get current NTB Format	Optional	[USBNCM10]
SetNtbFormat	Select 16 or 32 bit Network Transfer Blocks	Optional	[USBNCM10]
GetNtbInputSize	Get the current value of maximum  NTB input size		[USBNCM10]
SetNtbInputSize	Selects the maximum size of NTBs to be transmitted by the function over the bulk IN pipe	Required	[USBNCM10]
GetMaxDatagramSize	Requests the current maximum datagram size	Optional	8.1.3 Max Datagram Size
SetMaxDatagramSize	Sets the maximum datagram size to a value other than the default	Optional	8.1.3 Max Datagram Size
ResetFunction	Resets the function so it returns to the same state it has after a set config	Required	See 8.1.5 Reset

#### 8.1.1 SENDENCAPSULATEDCOMMAND

The SendEncapsulatedCommand is in principle the same as described in [USBCDC12] chapter 6.2.1, but with the following limitation: the host honors the wMaxControlMessage from the MBIM descriptor in such a way that wLength is never chosen to be longer than wMaxControlMessage. If the CID is longer than wMaxControlMessage, then the host fragments the message according to section 9.5 Fragmentation of messages. In case of fragmented messages, the host sends maximum-length transfers (full transfers for which wLength equals wMaxControlMessage) up to the very last fragment. The last fragment could, of course, be smaller than a maximum-length transfer.

This request is used to issue a command in the format of the supported control protocol of the Communications Class interface. The following table is copied from [USBCDC12] as a reference.

	Mobile Broadband Interface Model	
42		November 14, 2011

**Table 8-2: Send Encapsulated Command** 

bmRequestType	bRequestCode	wValue	wIndex	wLength	Data
00100001B	SEND_ENCAPSULATED _COMMAND	Zero	Interface	Amount of data, in bytes, associated with this recipient.	Control protocol- based command

#### 8.1.2 GETENCAPSULATEDRESPONSE

The GetEncapsulatedResponse is in principle the same as described in [USBCDC12] chapter 6.2.2, but with the following limitation: the host honors the wMaxControlMessage from the MBIM descriptor in such a way that wLength always is chosen to be wMaxControlMessage. Then the function can send as much data as it has. The following table is copied from [USBCDC12] as a reference.

**Table 8-3: Get Encapsulated Response** 

bmRequestType	bRequestCode	wValue	wIndex	wLength	Data
10100001B	GET_ENCAPSULATED _RESPONSE	Zero	Interface	Amount of data, in bytes, associated with this recipient.	Protocol- dependent data

The host does not continuously poll the default pipe for input control messages. When the MBIM function is ready to send a control message to the host, the function must return a RESPONSE\_AVAILABLE notification on the Communication Class interface's Interrupt IN endpoint. The transfer from the function's interrupt IN endpoint to the host is a standard USB Interrupt IN transfer

Upon receiving the RESPONSE\_AVAILABLE notification, the host reads the control message from the Control endpoint using a GET\_ENCAPSULATED\_RESPONSE transfer, defined in [USBCDC12] chapter 6.2.2. The function must use a separate GET\_ENCAPSULATED\_RESPONSE transfer for each control message it has to send to the host (that is, the function must not concatenate multiple messages into a single GET\_ENCAPSULATED\_RESPONSE transfer). The function must send a RESPONSE\_AVAILABLE notification for each available ENCAPSULATED\_RESPONSE to be read from the default pipe. For example, if the function has 4 ENCAPSULATED\_RESPONSES available, it would send 4 RESPONSE\_AVAILABLE notifications over the interrupt IN pipe. Per [USB30] section 8.12.2.2, each RESPONSE\_AVAILABLE notification must be Zero Length Packet (ZLP) terminated if the length is an exact

Mobile Broadband Interface Model

multiple of the wMaxPacketSize of the Endpoint Descriptor (see [USB30], table 9-18) for interrupt endpoint. The ENCAPSULATED\_RESPONSE must also be ZLP terminated if the size returned is a multiple of the bMaxPacketSizeO and is not equal to wLength in the GET\_ENCAPSULATED\_RESPONSE request (see [USB30] Table 9-8).

#### 8.1.3 MAX DATAGRAM SIZE

For both GetDatagramSize and SetDatagramSize, per table Table 8-1: Networking Control Model Requests, these optional requests are implemented per [USBNCM10]. However, there is an exception: the value of wMaxSegmentSize used is now specified in the MBIM functional descriptor Table 6-3: MBIM FUNCTIONAL DESCRIPTOR. In MBIM, the default and minimum value of wMaxSegmentSize is 2048.

#### 8.1.4 **NOTIFICATIONS**

The only notification used from chapter 6.3 in [USBNCM10] is ResponseAvailable. This notification is mandatory in this specification, whereas it was optional in [USBNCM10].

#### 8.1.5 **RESET FUNCTION**

RESET\_FUNCTION resets the function to its initial state. All IP data stream connections are disconnected; all Device Service Streams are closed. If the function is open using MBIM\_OPEN, it is returned to the closed state. The function shall abandon all outstanding transactions that are awaiting completion. No notifications shall be sent.

The data toggles of bulk and interrupts pipes are not affected. The alternate settings of interfaces are not changed. [USB30] remote-wakeup enable for the function is not affected. Other state controlled by the [USB30] core specification is similarly not affected.

The intended use of this request is to allow a host to return the function to a known state. It differs from USB reset, in that only the targeted function is affected by this request. Other functions in a composite device are not affected by this request. USB transport-level state is not affected by this request.

**Table 8-4: Reset Function** 

bmRequestType	bRequestCode	wValue	wIndex	wLength	Data
00100001B	RESET_FUNCTION	Zero	Interface	Zero	Zero

### 8.1.6 ERROR HANDLING

See specification [USB20] and [USB30]

Mobile Broadband Interface Model

# 9 MBIM CONTROL MESSAGES

MBIM control messages must be supported by an MBIM function. In the more detailed descriptions below, the messages include a TransactionId field. This is used to match sent messages with responses. With this mechanism, a host can send multiple MBIM messages to a function concurrently without concern for the ordering of responses. An MBIM function must maintain the TransactionId field when returning a response. For notifications, the TransactionId must be set to 0 by the function.

### 9.1 MBIM MESSAGE HEADER

All MBIM control messages must start with the following header.

Table 9-1: MBIM\_MESSAGE\_HEADER

Offset	Size	Field	Туре	Description
0	4	MessageType	UINT32	Specifies the MBIM message type. See Table 9-3: Control messages sent from the host to the function, and Table 9-9: Control Messages sent from function to host The Most Significant Bit in the MessageType indicates
4	4	MessageLength	UINT32	<ul> <li>direction:</li> <li>MSB set to 0: from host to function</li> <li>MSB set to 1: from function to host</li> </ul> Specifies the total length of this MBIM message in
				bytes.
8	4	TransactionId	UINT32	Specifies the MBIM message id value. This value is used to match host-sent messages with function responses. This value must be unique among all outstanding transactions. For notifications, the TransactionId must be set to 0 by the function.

### 9.2 MBIM FRAGMENT HEADER

If the size of a command or a response is larger than MaxControlTransfer, the message may be split across multiple messages. This header indicates how many fragments there are in total. For fragmentation considerations, see section 9.5 (Fragmentation of messages).

Table 9-2: MBIM\_FRAGMENT\_HEADER

Offset	Size	Field	Туре	Description
0	4	TotalFragments	UINT32	This field indicates how many fragments there are in total. For fragmentation considerations, see section 9.5 (Fragmentation of messages).
4	4	CurrentFragment	UINT32	This field indicates which fragment this message is.  Values are 0 to TotalFragments-1

#### 9.3 CONTROL MESSAGES SENT FROM THE HOST TO THE FUNCTION

The following MessageType values are defined for messages sent from the host to an MBIM function.

Table 9-3: Control messages sent from the host to the function

Message Identifier	Value	Description
MBIM_OPEN_MSG	1	Initialize the function.
MBIM_CLOSE_MSG	2	Closes the function.
MBIM_COMMAND_MSG	3	Send a 'COMMAND' CID.
MBIM_HOST_ERROR_MSG	4	Indicates an error in the MBIM communication.

A control message from the host to the device is sent in the payload of a SEND\_ENCAPSULATED\_COMMAND (see 8.1.1 on SendEncapsulatedCommand).

The function is either in a Closed or Opened global state (as opposed to the Ready States in Table 10-16: Table 10-16: MBIM\_SUBSCRIBER\_READY\_STATE), and these transitions occur as follows:

A device is initially (upon enumeration) in the Closed state.

ľ	Nobile Broadband Interface Model

The function transitions from the Closed to the Opened state when it responds to an MBIM OPEN MSG with an MBIM OPEN DONE whose Status field is set to MBIM ERROR STATUS SUCCESS.

The function transitions from the Opened state to the Closed state when it sends an MBIM\_CLOSE\_DONE to the host.

#### 9.3.1 MBIM\_OPEN\_MSG

This message is sent by the host to begin interacting with the function. The message is only sent when the device is in the Closed state.

The function indicates that it has been successfully opened by responding with MBIM\_OPEN\_DONE.

Right after the function has been successfully opened, the host cannot make any assumptions about the function's current state other than what is implied by the function completing the MBIM CLOSE MSG. Once the open message has been successfully completed it is recommended that the host make sure that state-change notifications are enabled for all states the host finds relevant. The host can then query the function's current state for all relevant states. This will ensure that the host and function are synchronized.

In case this message is sent to a function that is already opened, the function shall interpret this as that the host and the function are out of synchronization. The function shall then perform the actions dictated by the MBIM CLOSE MSG before it performs the actions dictated by this command. The function shall not send the MBIM\_CLOSE\_DONE when the transition to the Closed state has been completed. Only the MBIM OPEN DONE message is sent upon successful completion of this message.

See Table 9-4 for details of the message.

#### 9.3.1.1 MBIM\_OPEN\_MSG FORMAT

Table 9-4: MBIM\_OPEN\_MSG

Offset	Size	Field	Туре	Description
0	12	MessageHeader	MBIM_MESSAGE_HEADER	A message header as specified in Table 9-1: MBIM_MESSAGE_HEADER with MessageType set to MBIM_OPEN_MSG.

Offset	Size	Field	Туре	Description
12	4	MaxControlTransfer	UINT32	Maximum control transfer the host supports. This is the size the host will use for GetEncapsulatedResponse. If the function does not support this, it returns MBIM_ERROR_MAX_TRANSFER per Table 9-8: MBIM_PROTOCOL_ERROR_CODE S. This must not exceed wMaxControlMessage from Table 6-3: MBIM FUNCTIONAL DESCRIPTOR.

#### 9.3.2 MBIM\_CLOSE\_MSG

This message is sent by the host in order to terminate to the host's session with the function.

Between the host's sending this message and the function's completing this message (acknowledged with MBIM\_CLOSE\_DONE), the function can expect that no MBIM control messages are sent by the host on the control plane or data on the bulk pipes, and the function shall ignore any such messages.

The function shall not send any MBIM control messages on the control plane or data on the bulk pipes after completing this message (acknowledging it with the MBIM\_CLOSE\_DONE message) with one exception and that is MBIM\_ERROR\_NOT\_OPENED. MBIM\_ERROR\_NOT\_OPENED shall be sent by the function if the host sends an MBIM\_COMMAND\_MSG message to the function while the function is in a "Closed" state (e.g., prior to MBIM\_OPEN\_DONE or after an MBIM\_CLOSE\_DONE),

When the function has completed this message and acknowledged it, the only MBIM control message the host may send is the MBIM\_OPEN\_MSG.

Any active context between the function and the host shall be terminated. Note: this is specific to the link between device and host.

This message may be sent at any time the device is in the Opened state.

Mobile Broadband Interface Model

Table 9-5: MBIM\_CLOSE\_MSG Message

Offset	Size	Field	Туре	Description
0	12	MessageHeader	MBIM_MESSAGE_HEADER	A message header as specified in Table 9-1: MBIM_MESSAGE_HEADER with MessageType set to MBIM_CLOSE_MSG.

### 9.3.3 MBIM\_COMMAND\_MSG

MBIM\_COMMAND\_MSG is sent to a MBIM device from a host when it needs to query or set state on device. The parameter or statistics being queried for is identified by means of a Command Identifier (CID). Whether the command is setting or querying is determined by the CommandType. The host may send MBIM\_COMMAND\_MSG to the device via the control channel at any time that the device is in the Opened state. A MBIM device will respond to MBIM\_COMMAND\_MSG with information about the desired capabilities or status.

### 9.3.3.1 MBIM\_COMMAND\_MSG FORMAT

Table 9-6: MBIM\_COMMAND\_MSG Message

Offset	Size	Field	Туре	Description
0	12	MessageHeader	MBIM_MESSAGE_ HEADER	A message header as specified in Table 9-1: MBIM_MESSAGE_HEADER with MessageType set to MBIM_COMMAND_MSG.
12	8	FragmentHeader	MBIM_FRAGMENT _HEADER	A fragmentation header as specified in Table 9-2: MBIM_FRAGMENT_HEADER For fragmentation considerations, see section 9.5 (Fragmentation of messages).
20	16	DeviceServiceId	UUID	A 16-byte UUID that identifies the device service the following CID value applies.
36	4	CID	UINT32	Specifies the CID that identifies the parameter being queried for
40	4	Command type	UINT32	0 for a query operation, 1 for a Set operation.

Offset	Size	Field	Туре	Description
44	4	InformationBufferLength	UINT32	Size of the Total InformationBuffer, may be larger than current message if fragmented.
48		InformationBuffer	DATABUFFER	Data supplied to device specific to the CID

#### 9.3.4 MBIM\_HOST\_ERROR\_MSG OR MBIM\_FUNCTION\_ERROR\_MSG

An MBIM\_X\_ERROR\_MSG (referring to either MBIM\_HOST\_ERROR\_MSG or MBIM\_FUNCTION\_ERROR\_MSG) shall be sent to indicate an error in the MBIM protocol. MBIM\_HOST\_ERROR\_MSG is used for messages that are sent from the host to the function. MBIM\_FUNCTION\_ERROR\_MSG is used for error messages that are sent from the function to the host. These messages can be sent from host and function to indicate that a received message was formatted incorrectly. These messages are meant to be used for debugging as there is no guarantee that any corrective action triggered by them will be effective at all. An MBIM\_X\_ERROR\_MSG shall not be sent in response to an MBIM\_X\_ERROR\_MSG. An MBIM\_X\_ERROR\_MSG shall not make use of a DataBuffer, so it cannot send any data payload.

Table 9-7: MBIM\_HOST\_ERROR\_MSG or MBIM\_FUNCTION\_ERROR\_MSG

Offset	Size	Field	Type	Description
0	12	MessageHeader	MBIM_MESSAGE_HEADER	A message header as specified in Table 9-1: MBIM_MESSAGE_HEADER with MessageType set to MBIM_X_ERROR_MSG. If the message is sent from the device to the host the MSB will also be set.
12	4	ErrorStatusCode	MBIM_PROTOCOL_ERROR _CODES	See Table 9-8: MBIM_PROTOCOL_ERROR_CODES.

### Table 9-8: MBIM\_PROTOCOL\_ERROR\_CODES

Message Identifier	Value	Description
--------------------	-------	-------------

N	Nobile Broadband Interface Model

Message Identifier	Value	Description
MBIM_ERROR_TIMEOUT_FRAGMENT	1	Shall be sent by the receiver if the time between the fragments exceeds the max fragment time.  See 9.3.4.1
MBIM_ERROR_FRAGMENT_OUT_OF_ SEQUENCE	2	Shall be sent by the receiver if a fragmented message is sent out of sequence See 9.3.4.2
MBIM_ERROR_LENGTH_MISMATCH	3	Shall be sent by the receiver if the InformationBufferLength with required padding does not match the total of MessageLength minus headers  See 9.3.4.3
MBIM_ERROR_DUPLICATED_TID	4	Shall be sent by the receiver if two MBIM commands are sent with the same TID  See 9.3.4.4
MBIM_ERROR_NOT_OPENED	5	The function shall respond with this error code if it receives any MBIM commands prior to an open command or after a close command.  See 9.3.4.5.
MBIM_ERROR_UNKNOWN	6	Shall be sent by the function when an unknown error is detected on the MBIM layer. Expected behavior is that the host resets the function if a MBIM_ERROR_UNKNOWN is received.
MBIM_ERROR_CANCEL	7	Can be sent by the host to cancel a pending transaction.  See section 9.3.4.6.

	Mobile Broadband Interface Model	
52		November 14, 2011

Message Identifier	Value	Description
MBIM_ERROR_MAX_TRANSFER	8	Shall be sent if the function does not support the maximum control transfer the host supports.  See 9.3.1.1.

#### 9.3.4.1 MBIM\_ERROR\_TIMEOUT\_FRAGMENT

A host or function that receives fragmented messages shall send an MBIM\_X\_ERROR\_MSG if the time between the fragments exceeds 1250 ms. A host or function that receives fragmented messages shall not send an MBIM\_X\_ERROR\_MSG if the time between the fragments is less than 750 ms. The time between fragments is defined as the time between the end of the Status Stage of one fragment and the beginning of the Setup Stage of the next fragment (see section 8.5.3 in [USB2.0] and section 8.12.2 in [USB3.0]). The TransactionId of the responding message must match the TransactionId in the faulty fragmented sequence. In case of a timeout error, the receiver shall discard all the packets with the same TransactionId as the faulty message sequence.

#### 9.3.4.2 MBIM ERROR FRAGMENT OUT OF SEQUENCE

If a host or function detects a fragmented message that is out of order, e.g., the CurrentFragment is not 0 or in-order, the receiver shall send a MBIM\_X\_ERROR\_MSG with status code MBIM\_ERROR\_FRAGMENT\_OUT\_OF\_SEQUENCE. The TransactionId of the responding message must match the TransactionId in the faulty fragmented sequence. In case of an out of a sequence error, the receiver shall discard all the packets with the same TransactionId as the faulty message sequence.

The sender shall stop transmitting the remaining packets with that TransactionId as soon as it receives the error message. However, if the receiver gets one more message that is out of order for the same TransactionId, it shall send a new error message with the same TransactionId once more.

#### 9.3.4.3 MBIM\_ERROR\_LENGTH\_MISMATCH

If the host or the function receives a message where the InformationBufferLength does not match the total of the MessageLength, minus headers, of all fragmented packets the receiver shall send a MBIM\_X\_ERROR\_MSG with status code MBIM\_ERROR\_LENGTH\_MISMATCH. The TransactionId of the responding message must match the TransactionId of the faulty message. In case of a MBIM\_ERROR\_LENGTH\_MISMATCH all packets with the same TransactionId shall be discarded.

#### 9.3.4.4 MBIM ERROR DUPLICATED TID

If the host or the function receives a message with the same TransactionId as another message that is still being processed, the receiver shall send a MBIM\_X\_ERROR\_MSG with status code MBIM\_ERROR\_DUPLICATED\_TID. The TransactionId of the responding message shall match the

Mobile Broadband Interface Model

TransactionId in the faulty message. In case of an MBIM\_ERROR\_DUPLICATED\_TID error, the receiver shall discard the newly arrived message.

#### 9.3.4.5 MBIM ERROR NOT OPENED

The three following paragraphs talk about three different scenarios. The order is roughly chronological, according to what the host is sending to the function: MBIM\_COMMAND\_MSG (via the control channel), data (via the data channel) and MBIM\_CLOSE\_MSG (via the control channel):

If the host sends an MBIM\_COMMAND\_MSG message to the function while the function is in a "Closed" state (e.g. prior to MBIM\_OPEN\_DONE or after a MBIM\_CLOSE\_DONE), the function shall respond with an MBIM\_FUNCTION\_ERROR\_MSG message whose status code is set to MBIM\_ERROR\_NOT\_OPENED. This status code gives an indication to the host that the function and the host are not synchronized, and that the function is in "Closed" state.

If the host sends data traffic to the function, the function shall send an MBIM\_FUNCTION\_ERROR\_MSG with status code MBIM\_ERROR\_NOT\_OPENED if it is in "Closed" state.

If the host sends MBIM\_CLOSE\_MSG while the function is still powering up (and hence not yet out of the "Closed" state), the function shall respond with an MBIM\_FUNCTION\_ERROR\_MSG with MBIM\_ERROR\_NOT\_OPENED status code. The host can send an MBIM\_OPEN\_MSG immediately after receiving such a response.

#### 9.3.4.6 MBIM ERROR CANCEL

In case of a cancel, the receiver shall try to cancel the outstanding operations indicated by the MBIM\_COMMAND\_MSG with the same TransactionId as specified in the cancel message. The receiver must not send any MBIM\_COMMAND\_DONE message after it has received a MBIM\_ERROR\_CANCEL message. However due to timing issues the sender must handle that a MBIM\_COMMAND\_DONE could have been sent from the receiver in the time between sending and receiving the MBIM\_ERROR\_CANCEL.

The TransactionId of the responding message must match the TransactionId in the previous message in the sequence (if available). In case of a cancel error, the receiver shall discard all the packets with the same TransactionId as indicated in the MBIM ERROR CANCEL message.

### 9.4 CONTROL MESSAGE SENT FROM FUNCTION TO HOST

Table 9-9: Control Messages sent from function to host

Message Identifier	Value	Description
MBIM_OPEN_DONE	80000001h	Device response to initialization request

Message Identifier	Value	Description
		(MBIM_OPEN_MSG).
MBIM_CLOSE_DONE	80000002h	Device response to Close request (MBIM_CLOSE_MSG).
MBIM_COMMAND_DONE	80000003h	Device response to command' CID request (MBIM_COMMAND_MSG)
MBIM_FUNCTION_ERROR_MSG	80000004h	Indicates an error in the MBIM communication.
MBIM_INDICATE_STATUS_MSG	80000007h	Indicates unsolicited network or devices status changes

Control message layout for messages sent from the function to the host.

The data of the control messages is retrieved by sending a GET\_ENCAPSULATED\_RESPONSE to the function. The information will be contained in the data returned from this command. See section 8.1.2 on GetEncapsulatedResponse.

#### 9.4.1 MBIM\_OPEN\_DONE

The function initializes itself. Statistics per section 10.5.34 must be reset at this point. Notifications for CIDs defined in this specification are enabled upon OPEN\_DONE completion. Vendor extension notifications are off by default. All filters in section 10.5.30 (see Table 10-142: MBIM\_DEVICE\_SERVICE\_SUBSCRIBE\_LIST) and section 10.5.37 (MBIM\_CID\_IP\_PACKET\_FILTERS) are to be cleared at this point.

The function shall respond to the MBIM\_OPEN\_MSG message with an MBIM\_OPEN\_DONE message in which the TransactionId must match the TransactionId in the MBIM\_OPEN\_MSG.

The Status field shall be set to MBIM\_STATUS\_SUCCESS if the function initialized successfully; otherwise it shall be set to an error code indicating the failure.

#### Table 9-10: MBIM\_OPEN\_DONE

Offset	Size	Field	Туре	Description

N	Nobile Broadband Interface Model

Offset	Size	Field	Туре	Description
0	12	MessageHeader	MBIM_MESSAGE_HEADER	A message header as specified in Table 9-1:  MBIM_MESSAGE_HEADER with MessageType set to MBIM_OPEN_DONE.
12	4	Status	MBIM_STATUS_CODES	Specifies the status of processing the Open request. See Table 9-15: MBIM_STATUS_CODES

#### 9.4.2 MBIM\_CLOSE\_DONE

The device will respond to the MBIM\_CLOSE\_MSG message with an MBIM\_CLOSE\_DONE message. The TransactionId of the responding message must match the TransactionId in the MBIM\_CLOSE\_MSG.

Table 9-11: MBIM\_CLOSE\_DONE

Offset	Size	Field	Туре	Description
0	12	MessageHeader	MBIM_MESSAGE_HEADER	A message header as specified in Table 9-1:  MBIM_MESSAGE_HEADER with MessageType set to MBIM_CLOSE_DONE.
12	4	Status	MBIM_STATUS_CODES	Specifies the status of processing the Close request. This field shall always be set to MBIM_STATUS_SUCCESS. See Table 9-15: MBIM_STATUS_CODES.

### 9.4.3 MBIM\_COMMAND\_DONE

The function shall send MBIM\_COMMAND\_DONE to the host in response to MBIM\_COMMAND\_MSG. This message is used to relay the result of executing the command, and may also contain additional result values.

Table 9-12 defines the structure of the MBIM\_COMMAND\_DONE message. The TransactionId of the responding message must match the TransactionId in the MBIM\_COMMAND\_MSG.

	Mobile Broadband Interface Model	
56		November 14 2011

Table 9-12: MBIM\_COMMAND\_DONE

Offset	Size	Field	Туре	Description
0	12	MessageHeader	MBIM_MESSAGE_HEADER	A message header as specified in Table 9-1:  MBIM_MESSAGE_HEADER with MessageType set to MBIM_COMMAND_DONE.
12	8	FragmentHeader	MBIM_FRAGMENT_HEADER	A fragmentation header as specified in Table 9-2: MBIM_FRAGMENT_HEADER For fragmentation considerations, see section 9.5 (Fragmentation of messages).
20	16	DeviceServiceId	UUID	A 16-byte UUID that identifies the device service the following CID value applies.
36	4	CID	UINT32	Specifies the CID that identifies the parameter being that this message is completing
40	4	Status	MBIM_STATUS_CODES	Specifies the status of processing the CID set/query request. See section 9.4.5.
44	4	InformationBufferLength	UINT32	Length of the InformationBuffer. May exceed the length of this message if fragmented.
48		InformationBuffer	DATABUFFER	Holds any information retuned from the function. May be empty.

N A . I 'I .	D II			N.A I. I
MODILE	Broadb	and into	ertace	Model

### 9.4.4 MBIM\_INDICATE\_STATUS\_MSG

The function may send MBIM\_INDICATE\_STATUS\_MSG to the host via the control channel in an unsolicited fashion at any time that the device has been opened. This message is used to indicate a change in the status of the device. The specific event that is being indicated is identified DeviceServiceId and CID. The contents of the InformationBuffer are specific to the CID.

### 9.4.4.1 MBIM\_INDICATE\_STATUS\_MSG FORMAT

Table 9-13: MBIM\_INDICATE\_STATUS\_MSG Message

Offset	Size	Field	Туре	Description
0	12	MBIM_Message_Header	MBIM_MESSAGE_HEADER	A message header as specified in Table 9-1: MBIM_MESSAGE_HEADER with MessageType set to MBIM_INDICATE_STATUS.
12	8	FragmentHeader	MBIM_FRAGMENT_HEADER	A fragmentation header as specified in Table 9-2: MBIM_FRAGMENT_HEADE R For fragmentation considerations, see section 9.5 (Fragmentation of messages).
20	16	DeviceServiceId	UUID	A 16 byte UUID that identifies the device service to which the following Status ID applies.
36	4	CID	UINT32	Specifies the CID that this indication matches.
40	4	InformationBufferLength	UINT32	Length of the InformationBuffer.
44		InformationBuffer	DATABUFFER	Variable length InformationBuffer. Possibly empty.

	Mobile Broadband Interface Model	
58		November 14, 2011

#### 9.4.5 USE OF THE STATUS CODES

For a complete list of the Status codes and their descriptions, please refer to Table 9-15:

MBIM\_STATUS\_CODES. If the CID is successful, the function shall set the Status field to

MBIM\_STATUS\_SUCCESS in the MBIM\_COMMAND\_DONE, and send back whatever information is

specified by the CID in the InformationBuffer field (Table 9-12: MBIM\_COMMAND\_DONE) and, possibly, in the dynamic DataBuffer field as well. If the Status field returned to the host is not equal to

MBIM\_STATUS\_SUCCESS, the device must set the InformationBufferLength to 0, indicating an empty InformationBuffer. However, there are exceptions to this rule. In some cases called out explicitly below, a Status value other than MBIM\_STATUS\_SUCCESS could be accompanied by further information in the field NwError within the InformationBuffer. In these cases, the function must follow the specification for the CID in question and send back the required information, while zeroing out all irrelevant fields. Such cases are specified for the following CIDs:

- MBIM\_CID\_REGISTER\_STATE
- MBIM\_CID\_PACKET\_SERVICE
- MBIM\_CID\_CONNECT
- MBIM\_CID\_SERVICE\_ACTIVATION

Of course, future CIDs defined using the extensibility defined in this specification (see section 10.6 on MBIM Service and CID extensibility) may possibly create other similar exceptions.

If the function does not implement the CID, then the function shall fail the request with MBIM STATUS NO DEVICE SUPPORT.

Section 10.3 provides more detailed guidance about the failure status codes to be returned for each CID. Within Section 10.3, generic status codes that apply to all or many CIDs are not repeated for each CID. These Generic Status Codes, along with the CIDs to which they apply, are listed in Table 9-14: Generic Status Codes and their Relevant CIDs. These Generic Status codes are usable by all CIDs. Nevertheless, some of them are still mentioned explicitly in the CID subsections for completeness sake, even if such mention is not necessary (e.g., MBIM\_STATUS\_BUSY).

In the absence of a better status code to describe a failure, the function must return the generic failure code MBIM\_STATUS\_FAILURE.

Table 9-14: Generic Status Codes and their Relevant CIDs

Generic Status Codes	Relevant Commands

## Table 9-15: MBIM\_STATUS\_CODES

Name	Value	Description	
MBIM_STATUS_SUCCESS	0	The operation succeeded.	
MBIM_STATUS_BUSY	1	The operation failed because the device is busy.	
		In the absence of any explicit information from	
		the function to clear this condition, the host can	
		use subsequent actions by the function (e.g.,	
		notifications or command completions) as a hint	
		to retry the failed operation.	
MBIM_STATUS_FAILURE	2	The operation failed (a generic failure).	
MBIM_STATUS_SIM_NOT_INSERTED	3	The operation failed because the SIM card was	
		not fully inserted in to the device.	
MBIM_STATUS_BAD_SIM	4	The operation failed because the SIM card is bad	
		and cannot be used any further.	
MBIM_STATUS_PIN_REQUIRED	5	The operation failed because a PIN must be	
		entered to proceed.	
MBIM_STATUS_PIN_DISABLED	6	The operation failed because the PIN is disabled.	
Mobile Broadband Interface Model			

62 November 14, 2011

MBIM_STATUS_NOT_REGISTERED	7	The operation failed because the device is not	
		registered with any network.	
MBIM_STATUS_PROVIDERS_NOT_FOUND	8	The operation failed because no network providers could be found.	
MBIM_STATUS_NO_DEVICE_SUPPORT	9	The operation failed because the device does not support the operation.	
MBIM_STATUS_PROVIDER_NOT_VISIBLE	10	The operation failed because the service provider	
		is not currently visible.	
MBIM_STATUS_DATA_CLASS_NOT_AVAIL	11	The operation failed because the requested data-	
ABLE		class was not available.	
MBIM_STATUS_PACKET_SERVICE_DETACH ED	12	The operation failed because the packet service is detached.	
MBIM_STATUS_MAX_ACTIVATED_CONTEX	13	The operation failed because the maximum	
TS		number of activated contexts has been reached.	
MBIM_STATUS_NOT_INITIALIZED	14	The operation failed because the device is in the	
		process of initializing. Retry the operation after	
		the ReadyState of the device changes to	
		MBIMSubscriberReadyStateInitialized.	
MBIM_STATUS_VOICE_CALL_IN_PROGRES	15	The operation failed because a voice call is in	
S		progress.	
MBIM_STATUS_CONTEXT_NOT_ACTIVATE	16	The operation failed because the context is not	
D		activated.	
MBIM_STATUS_SERVICE_NOT_ACTIVATED	17	The operation failed because service is not activated.	
MBIM_STATUS_INVALID_ACCESS_STRING	18	The operation failed because the access string is invalid.	
MBIM_STATUS_INVALID_USER_NAME_P WD	19	The operation failed because the username and/or password supplied are invalid.	
MBIM_STATUS_RADIO_POWER_OFF	20	The operation failed because the radio is	
		currently powered off.	
MBIM_STATUS_INVALID_PARAMETERS	21	The operation failed because of invalid	
		parameters.	
MBIM_STATUS_READ_FAILURE	22	The operation failed because of a read failure.	
MBIM_STATUS_WRITE_FAILURE	23	The operation failed because of a write failure.	
Reserved	24		
MBIM_STATUS_NO_PHONEBOOK	25	The phonebook operation failed because there is	
		no phone book.	
MBIM_STATUS_PARAMETER_TOO_LONG	26	A parameter with dynamic size is larger than the	
		function can handle	
MBIM_STATUS_STK_BUSY	27	The SIM Toolkit application on the SIM card is	
		busy and the command could not be processed	
MBIM_STATUS_OPERATION_NOT_ALLOW ED	28	The operation failed because the operation is not allowed.	
Mobile Broadband Interface Model			
Mobile Broadband Interface Model			

MBIM_STATUS_MEMORY_FAILURE	29	The phonebook or sms operation failed because
		the because of device or SIM memory failure.
MBIM_STATUS_INVALID_MEMORY_INDEX	30	The phonebook or sms operation failed because
		of an invalid memory index.
MBIM_STATUS_MEMORY_FULL	31	The phonebook or sms operation failed because
		the device or SIM memory is full.
MBIM_STATUS_FILTER_NOT_SUPPORTED	32	The phonebook or sms operation failed because
		the filter type is not supported.
MBIM_STATUS_DSS_INSTANCE_LIMIT	33	Attempt to open a device service failed because
		the number of opened streams has reached the
		device service instance limit for this service.
MBIM_STATUS_INVALID_DEVICE_SERVICE	34	The device service operation attempted is invalid.
OPERATION		The device service operation attempted is invalid.
MBIM_STATUS_AUTH_INCORRECT_AUTN	35	The device sets this error on an AKA or AKAPrime
		challenge response when the AKA or AKAPrime
		challenge sent has incorrect AUTN.
MBIM_STATUS_AUTH_SYNC_FAILURE	36	The device sets this error on a an AKA or
MBINI_STATES_ASTAL_STATE_TAILESTATE		AKAPrime challenge response when the AKA or
		AKAPrime challenge sent has synchronization
		failure. When this error code is returned the
		AUTS field would be set.
MBIM_STATUS_AUTH_AMF_NOT_SET	37	The device sets this error on a an AKA or
I WIDHWI_STATOS_AOTTI_AWII_WOT_SET	37	AKAPrime challenge response when the AKA or
		AKAPrime challenge response when the AKA of AKAPrime challenge sent does not have the AMF
		bit set to 1.
MBIM_STATUS_SMS_UNKNOWN_SMSC_A	100	The SMS operation failed because the service
DDRESS	100	center address is either invalid or unknown.
	101	
MBIM_STATUS_SMS_NETWORK_TIMEOUT	101	The SMS operation failed because of a network timeout.
NADINA CTATUS CNAS LANG NOT SUDDOD	102	
MBIM_STATUS_SMS_LANG_NOT_SUPPOR	102	The SMS operation failed because the SMS
TED		language is not supported. This applies to CDMA
	100	based devices only.
MBIM_STATUS_SMS_ENCODING_NOT_SU	103	The SMS operation failed because the SMS
PPORTED		encoding is not supported. This applies to CDMA
	10.5	based device only.
MBIM_STATUS_SMS_FORMAT_NOT_SUPP	104	The SMS operation failed because the SMS
ORTED		format is not supported.
Device service specific status commands	80000	
	000h-	
	FFFFF	
	FFFh	

Mobile	Broadband	Interface	: Model

If the MSB is set in the status message the DeviceServiceId (see section 9.4.4) shall be used to identify the status message namespace. This namespace is thus unique for each DeviceServiceId.

Mobile Broadband Interface Model

### 9.5 FRAGMENTATION OF MESSAGES

MBIM\_COMMAND\_MSG, MBIM\_COMMAND\_DONE and MBIM\_INDICATE\_STATUS\_MSG may be split across multiple encapsulated commands and responses due to limitation in the maximum size of a USB transfer across the control channel.

Fragmented messages can be identified by the TotalFragment field having a value greater than 1. The first fragment contains all of the message headers; the following fragments only contain the headers up to the current fragment field followed by the continuation of the InformationBuffer field.

See the below example of a fragmented MBIM\_COMMAND\_DONE message:

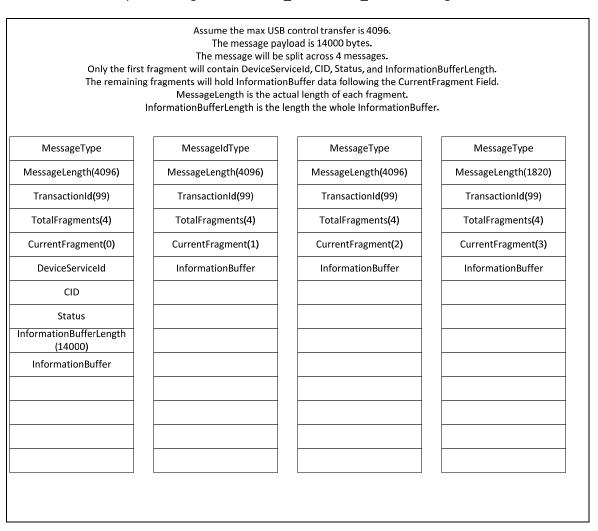

Figure 11: MBIM Message Fragmentation

In a fragment, MessageLength is the length of the current fragment, whereas InformationBufferLength is the total length of the InformationBuffer prior to fragmentation. Fragments shall be transmitted in back to back transfers without intermixing fragments from other messages.

66

Mobile Broadband Interface Model	
	November 14 2011

A host or function that receives fragmented messages shall send an MBIM\_X\_ERROR\_MSG with error code MBIM\_ERROR\_TIMEOUT\_FRAGMENT; if the time between the fragments is too long (see 9.3.4.1).

If a host or function receives a fragment that is out-of-order or is improperly formatted or in any other way is faulty, the receiver shall send an MBIM\_X\_ERROR\_MSG with the corresponding error code to the sender (see Table 9-8: MBIM\_PROTOCOL\_ERROR\_CODES).

If a host or function receives a faulty fragment, all the fragments with the same TransactionId shall be discarded.

Per section 1.2, this specification does not mandate behavior on hosts, so normative language above (and elsewhere) does not apply to hosts. Accordingly, devices must be prepared to handle any eventuality (for example, intermixed fragments from different messages).

Mobile Broadband Interface Model

# 10 MBIM-SPECIFIC COMMAND MECHANISM

Each CID allows either or both Query and Set operations from the host to the function. A Query enables the host to inquire as to the value or status of a given capability at the function. A Set enables the host to change a given capability at a function. CIDs may also allow indications from the function to the host, both to notify about command completions as well as for unsolicited events (also known as "unsolicited indications", "notifications" or "events").

To retrieve the information associated with a CID, the HOST sends a SEND\_ENCAPSULATED\_COMMAND with a payload of an MBIM\_COMMAND\_MSG. The CID field of the structure will have the value corresponding to the CID to be queried or set. When the function has retrieved the information in question, it notifies the host via the interrupt channel. The host then sends a GET\_ENCAPSULATED\_RESPONSE to the function to retrieve the information. If there is undue delay in either the function's notification via the interrupt channel, or in the host's response by issuing the GET\_ENCAPSULATED\_RESPONSE, this can be handled via an MBIM\_ERROR\_CANCEL (see section 9.3.4.6).

The information is formatted as an MBIM\_COMMAND\_DONE message, and the CID-specific information is located within the InformationBuffer.

A CID request to a function is identified via two parts: the DeviceServiceId and the CID value. The DeviceServiceId is the UUID which uniquely identifies the service for which the CID value or notification (section 10.1) is relevant. The CID value is a 32 bit value.

For transmission between a host and a function, a UUID is encoded as a 128-bit object, as follows: The fields are encoded as 16 octets, with the sizes and order of the fields defined below, and with each field encoded with the Most Significant Byte first (known as network byte order or big-endian order).

Table 10-1:	Transmission	structure of	of a UUID
-------------	--------------	--------------	-----------

Offset	Size	Field	Description
0	4	Data1	The 8 character portion of the UUID string ("a") as a bigendian 32 bit value
4	2	Data2	The first 4 character portion of the UUID string ("b") as a big-endian 16 bit value
6	2	Data3	The first 4 character portion of the UUID string ("c") as a big-endian 16 bit value
8	8	Data4	This field is composed of the third 4 character portion ("d") of the UUID string and the 12 character portion ("e") of the UUID string.  The byte values are transmitted in the order listed in the string.

	Mobile Broadband Interface Model	
68		November 1/1 2011

For example, a UUID string as follows would be transmitted as shown in Table 10-2: UUID transmission example.

{a1a2a3a4-b1b2-c1c2-d1d2-e1e2e3e4e5e6}

Table 10-2: UUID transmission example

		•	•			-		•	14	-		•	•		1	•
a:	1	a2	l a3	l a4	b1	b2	C1	c2	d1	d2	e1	e2	e3	l e4	e5	e6
٠	_	~-		<b>~</b> .	~ _	~-	~-	~-	·-	~-	~-	~-		<b>.</b>		

### 10.1 MBIM SERVICES AND THEIR CID VALUES

This specification defines the following services:

Table 10-3: Services Defined by MBIM

Service Name	UUID	UUID Value
Basic IP Connectivity	UUID_BASIC_CONNECT	a289cc33-bcbb-8b4f-b6b0-
		133ec2aae6df
SMS	UUID_SMS	533fbeeb-14fe-4467-9f90-
		33a223e56c3f
USSD (Unstructured	UUID_USSD	e550a0c8-5e82-479e-82f7-
Supplementary Service Data)		10abf4c3351f
Phonebook	UUID_PHONEBOOK	4bf38476-1e6a-41db-b1d8-
		bed289c25bdb
STK (SIM Toolkit)	UUID_STK	d8f20131-fcb5-4e17-8602-
		d6ed3816164c
Authentication	UUID_AUTH	1d2b5ff7-0aa1-48b2-aa52-
		50f15767174e
Device Service Stream	UUID_DSS	c08a26dd-7718-4382-8482-
		6e0d583c4d0e

The following table specifies the command code for each CID. Additionally, it also shows informatively (normative information is contained in each detailed per-CID explanation under section 10.5), whether the CID supports Query, Set or Events (notifications).Per-CID sections (see section 10.5) have details about what (if any) is the structure used for input parameters on a Query (Query InformationBuffer Payload), on a Set (Set InformationBuffer Payload), on command completion (Completion InformationBuffer payload), and on unsolicited Indications (asynchronous events also known as Notifications). Unsolicited indications are delivered via MBIM\_INDICATE\_STATUS\_MSG from the device to the host.

### **10.2 DATA TYPES**

MBIM uses the Data Types shown in Table 10-5: Data Types.

Table 10-5: Data Types

Types	Definition	Comments
UINT8	8-bit unsigned number	Used for 8-bit quantities and as a base type for arrays.
UUID	UINT8[16]	Used for UUID entities like Device Service IDs. See Table 10- 1: Transmission structure of a UUID
UINT16	16-bit unsigned number	Used for 16-bit quantities.
UINT32	32-bit unsigned number	Used for 32-bit quantities.
UINT64	64-bit unsigned number	Used for 64-bit quantities.
DATABUFFER	UINT8[variable-size]	The second part of the CID storage structure used for variable size fields (see section 10.3 CID Storage for Fixed and Variable Fields).
OFFSET	UINT32	Offset in bytes, calculated from the beginning of the CID structure, to a variable-sized data in the DATABUFFER. See section 10.4 Byte ordering and String Format.
SIZE (minmax)	UINT32	Size in bytes of the variable- sized data in the DATABUFFER. See section 10.4 Byte ordering and String Format.

Mobile Broadband Interface Model

OL_PAIR_LIST	List of Offset-Length Pairs	This data type is preceded by count (UINT32) of the number of pairs in the list.
		The first element in each pair is a 4 byte field with the Offset into the DataBuffer, calculated from the beginning (offset 0) of the enclosing structure to some data.
		The second element of easy pair is a 4 byte field with the size of the data pointed at by the first element.

### 10.3 CID STORAGE FOR FIXED AND VARIABLE FIELDS

The CID structures are stored in the InformationBuffer in an MBIM message see Table 9-6: MBIM\_COMMAND\_MSG Message. The CID structure consists of two contiguous structures: the first one, a static structure, is used for fixed size fields; the second part is a data buffer ("DataBuffer") used for variable size fields.

All fields (either static or variable size) start at a 4-byte boundary. Hence, all field offsets shall be multiples of 4. Between the end of a field (not necessarily at a 4-byte boundary) and the beginning of the next field (always at a 4-byte boundary), padding may be required. Padding bytes must be set to 0 upon transmission and ignored upon reception.

Strings, being variable in size, are stored in the DataBuffer. On the other hand, offsets to strings in the DataBuffer and sizes of strings, being fixed fields, are stored in the static part of the CID structures.

The offsets into the DataBuffer are counted from the beginning of the CID structure. Offsets shall be linearly increasing, non-overlapping and non-sparse except for alignment. An offset of zero indicates that the string is NULL (for example, to indicate the default APN per Table 10-67: MBIM\_SET\_CONNECT). If the offset is zero the size must also be set to zero.

The size field indicates the size in bytes of the variable field in the DataBuffer. The value for the size field shall only include the real size of the variable field's payload, without padding.

If the size of the payload in the variable field is not a multiple of 4 bytes, the field shall be padded up to the next 4 byte multiple. This shall be true even for the last payload in DataBuffer.

	Mobile Broadband Interface Model	
72		November 14 2011

The length of an array, as reflected by the size field, shall be a multiple of the size of the base type. For example, the size of UNICODE strings shall be a multiple of 2 bytes.

The function shall reject incoming messages that don't follow the rules for variable-length encoding by setting MBIM\_STATUS\_INVALID\_PARAMETERS as the status code in the MBIM\_COMMAND\_DONE message. For malformed notifications sent from the function to the host the behavior is unspecified.

### 10.4 BYTE ORDERING AND STRING FORMAT

Unless otherwise specified, all fields of MBIM control messages and CID related structures are in little-endian format per [USB30] section 7.1. Unless otherwise specified, all strings use UNICODE UTF-16LE encodings. Strings shall not be terminated by a NULL character. Instead, their length is specified explicitly.

### 10.5 MBIM CIDS DETAILED DESCRIPTIONS

This section contains the detailed CID descriptions for the defined device services.

All offsets in the CID sections below are calculated from the beginning of the InformationBuffer in Table 9-6: MBIM\_COMMAND\_MSG Message.

#### 10.5.1 MBIM CID DEVICE CAPS

#### 10.5.1.1 DESCRIPTION

#### Query only:

The function prepares and returns an MBIM\_DEVICE\_CAPS\_INFO structure in response to a MBIM\_COMMAND\_MSG with UUID\_BASIC\_CONNECT and CID MBIM\_CID\_DEVICE\_CAPS.

#### 10.5.1.2 PARAMETERS

#### Table 10-6: Parameters

	Set	Query	Notification
Command	NA	Empty	NA
Response	NA	MBIM_DEVICE_CAPS_INFO	NA

#### 10.5.1.3 DATA STRUCTURES

## Table 10-7: MBIM\_DEVICE\_TYPE

Types	Value	Description
MBIMDeviceTypeUnknown	0	The function type is unknown.

Mobile Broadband Interface Model

Types	Value	Description
MBIMDeviceTypeEmbedded	1	The function type is embedded in the system
MBIMDeviceTypeRemovable	2	The function is implemented within a device that is removable, for example, a pluggable USB device.
MBIMDeviceTypeRemote	3	The function type is remote, for example, a tethered cellular phone modem.

The MBIM\_CELLULAR\_CLASS bitmap is used to indicate the relevant cellular technologies. For example, dual-mode functions with both GSM and CDMA capabilities could turn both corresponding bits on in the context of function capabilities (Table 10-14: MBIM\_DEVICE\_CAPS\_INFO), whereas only one technology would typically be indicated in the context of MB service providers (Table 10-37: MBIM\_PROVIDER). A multi-mode device (both GSM and CDMA) with a single carrier must use MBIMCellularClassGsm as the primary mode. The device should use the primary mode to choose a single service where multiple exist among the cellular technologies. Specific requirements are highlighted where applicable in the following sections.

### Table 10-8: MBIM\_CELLULAR\_CLASS

Types	Mask
MBIMCellularClassGsm	1
MBIMCellularClassCdma	2

## Table 10-9: MBIM\_VOICE\_CLASS

Types	Value	Description
MBIMVoiceClassUnknown	0	The device uses an unknown method to support voice connections.
MBIMVoiceClassNoVoice	1	The device does not support voice connections
MBIMVoiceClassSeparateVoiceD ata	2	The device supports separate voice and data connections

	Mobile Broadband Interface Model	
74		November 14 2011

MBIMVoiceClassSimultaneousVo	3	The device supports simultaneous voice
iceData		and data connections

This is the voice class of the device. This member informs the host about the presence of circuit voice service, and how such service interacts with data service.

Table 10-10: MBIM\_SIM\_CLASS

Types	Mask	Description
MBIMSimClassSimLogical	1	Functions that do not have a physical SIM, must set this bit. For example, devices supporting embedded SIM (embedded on QFN8 chips) must report this bit.
MBIMSimClassSimRemovable	2	Functions supporting physical SIMs that are removable by the end-user must set this bit. E.g., 3GPP devices supporting SIM, U-SIM, I-SIM, 3GPP2 devices supporting R-UIM, CSIM, etc., must report this bit as 1.

A bitmap that represents which radio technologies are supported by the function. The following table shows the possible values for this member.

Table 10-11: MBIM\_DATA\_CLASS

Types	Mask	Description
MBIMDataClassNone	0h	
MBIMDataClassGPRS	1h

Reserved	40h-	Reserved for future GSM
	8000h	classes
MBIMDataClass1XRTT	10000h	
MBIMDataClass1XEVDO	20000h	
MBIMDataClass1XEVDORevA	40000h	

Mobile Broadband Interface Model

MBIMDataClass1XEVDV	80000h	
MBIMDataClass3XRTT	100000h	
MBIMDataClass1XEVDORevB	200000h	
MBIMDataClassUMB	400000h	
Reserved	800000h-	Reserved for future CDMA
	40000000h	classes
MBIMDataClassCustom	80000000h	

Table 10-12: MBIM\_SMS\_CAPS

Types	Mask
MBIMSmsCapsNone	0
MBIMSmsCapsPduReceive	1
MBIMSmsCapsPduSend	2
MBIMSmsCapsTextReceive	4
MBIMSmsCapsTextSend	8

This is a bitmap that represents the type of SMS messages and directional flow that the device supports. The following table shows the valid SMS capabilities settings.

Table 10-13: MBIM\_CTRL\_CAPS

Types	Mask	Description
MBIMCtrlCapsNone	0h	No flags set
MBIMCtrlCapsRegManual	1h	Indicates whether the device allows manual network selection. Functions for GSM-based devices may specify this flag. Functions for CDMA-based devices must not specify this flag.
MBIMCtrlCapsHwRadioSwitch	2h	Indicates the presence of a hardware radio power switch
MBIMCtrlCapsCdmaMobileIp	4h	Indicates that the CDMA-based function is configured to support mobile IP. This flag applies only to CDMA-based functions
MBIMCtrlCapsCdmaSimpleIp	8h	Indicates that the CDMA-based function is configured for simple IP support. This flag applies only to CDMA-based functions
N	lobile Broadba	and Interface Model

76 November 14, 2011

MBIMCtrlCapsMultiCarrier	10h	Indicates that the device can work with
		multiple-providers

This is a bitmap that represents the control capabilities that the device supports. The following table shows the valid MBIM\_CTRL\_CAPS settings for GSM-based and CDMA-based devices. Devices that support CDMA must specify MBIMCtrlCapsCdmaMobileIp, or MBIMCtrlCapsCdmaSimpleIp, or both flags to inform the host about the type of IP that the device supports.

As the connection credentials (AccessString, UserName, and Password) for simple IP are pre-configured, function firmware that supports both simple IP and mobile IP must report both capabilities, regardless of the runtime configuration or network capability in the current location.

Functions that support secured connection credentials, such as those using R-UIM, CSIM or SIM-less implementation, shall use a blank placeholder provisioned context.

These are capabilities of the device, and do not reflect what may be possible at any given point in time, as this is often determined by other factors such as network characteristics, technology, etc.

### 10.5.1.4 QUERY

The InformationBuffer shall be null and InformationBufferLength shall be zero.

#### 10.5.1.5 **RESPONSE**

The following structure shall be used in the InformationBuffer

Table 10-14: MBIM\_DEVICE\_CAPS\_INFO

Offset	Size	Field	Туре	Description
0	4	DeviceType	MBIM_DEVICE_TYPE	Device type. See Table 10-7: MBIM_DEVICE_TYPE.
4	4	CellularClass	MBIM_CELLULAR_CL ASS	Cellular class. See Table 10-8: MBIM_CELLULAR_CLASS.
8	4	VoiceClass	MBIM_VOICE_CLASS	Voice class. See Table 10-9: MBIM_VOICE_CLASS
12	4	SimClass	MBIM_SIM_CLASS	SIM class. See Table 10-10: MBIM_SIM_CLASS

Mobile Broadband Interface Model
----------------------------------

Offset	Size	Field	Туре	Description
16	4	DataClass	MBIM_DATA_CLASS	Data class. See Table 10-11:  MBIM_DATA_CLASS.
20	4	SmsCaps	MBIM_SMS_CAPS	SMS capabilities. See Table 10-12: MBIM_SMS_CAPS
24	4	ControlCaps	MBIM_CTRL_CAPS	Control capabilities. See Table 10-13: MBIM_CTRL_CAPS
28	4	MaxSessions	UINT32	The maximum number of activated IP data stream sessions that are supported by the function. The protocol allows up to 256 simultaneous IP streams. See Section 7 on Data Transport.
32	4	CustomDataClassOff set	OFFSET	Offset in bytes, calculated from the beginning of this structure, to a string CustomDataClass that represents the name of the custom data class if the DataClass bitmask contains 80000000h. Max length is 11 (16-bit) characters. If the DataClass bitmask does not contain 80000000h, then this field is reserved and shall be encoded as zero by the sender, and ignored by the receiver.
36	4	CustomDataClassSize	SIZE (022)	Size used for CustomDataClass

Offset	Size	Field	Туре	Description
40	4	DeviceIdOffset	OFFSET	Offset in bytes, calculated from the beginning of this structure, to a string DeviceId that represents the function ID. For GSM-based devices, the string must conform to the International Mobile Equipment Identity (IMEI) format (up to 15 digits). For CDMA-based devices, the string must conform to both the Electronic Serial Number (ESN, 8 or 11 digits) and Mobile Equipment Identifier (MEID, 14 or 18 digits) formats. This value should be stored in the device's memory and must be available even when the device/SIM requires a PIN to unlock. Max length is 18 (16-bit) characters. For multi-mode devices, only the GSM based DeviceId must be reported.
44	4	DeviceldSize	SIZE (036)	Size used for DeviceId
48	4	FirmwareInfoOffset	OFFSET	Offset in bytes, calculated from the beginning of this structure, to a string FirmwareInfo that represents firmware-specific information about the function.  Max length is 30 (16-bit) characters
52	4	FirmwareInfoSize	SIZE (060)	Size used for FirmwareInfo

# Mobile Broadband Interface Model

Offset	Size	Field	Туре	Description
56	4	HardwareInfoOffset	OFFSET	Offset in bytes, calculated from the beginning of this structure, to a string HardwareInfo that represents hardware-specific information about the function.  Max length is 30 16-bit characters.
60	4	HardwareInfoSize	SIZE (060)	Size used for HardwareInfo
64		DataBuffer	DATABUFFER	CustomDataClass DeviceId FirmwareInfo HardwareInfo

#### **10.5.1.6 STATUS CODES**

This CID only uses Generic Status Codes (see Use of the Status Codes section 9.4.5).

#### 10.5.2 MBIM\_CID\_SUBSCRIBER\_READY\_STATUS

#### 10.5.2.1 DESCRIPTION

The function prepares and returns an MBIM\_SUBSCRIBER\_READY\_INFO structure in response to an MBIM\_COMMAND\_MSG with UUID\_BASIC\_CONNECT and MBIM\_CID\_SUBSCRIBER\_READY\_STATUS. This structure contains the Subscriber Identity Module (SIM) card ready state as well as some information on the SIM card (SubscriberId, IccId, Telephone numbers). The information on the SIM card may not be accessible in all SIM-card states: some fields may not be accessible to the function before the SIM card is unlocked (see [3GPP31102] for access conditions to fields on the SIM card).

The initial ReadyState for the SIM card when the function is opened may be any of the ReadyStates as the function may have communicated with the SIM card prior to the MBIM\_OPEN\_DONE message is sent. The host is responsible to query for the ReadyState when the device has been opened. After the MBIM\_OPEN\_DONE message has been sent, the function shall always notify the host whenever the SIM ReadyState changes, using MBIM\_INDICATE\_STATUS\_MSG with UUID\_BASIC\_CONNECT and MBIM\_CID\_ SUBSCRIBER\_READY\_INFO.

For the states in the MBIM\_SUBSCRIBER\_READY\_STATE structure, the following shall be noted:

- Before the function knows the state of the SIM card or before it has finalized initializating the SIM card, the ReadyState is MBIMSubscriberReadyStateNotInitialized
- When the SIM card has been initialized and no other of the ReadyStates applies, the ReadyState is MBIMSubscriberReadyStateInitialized

	Mobile Broadband Interface Model	
80		November 14, 2011

• If the SIM card has been initialized and the SIM requires PIN1 or PUK1 to be entered, the ReadyState is MBIMSubscriberReadyStateLocked. The host can then unlock the SIM using a MBIM\_CID\_PIN set request. Note that the function may need another unlock code to be entered before the PIN1/PUK1 code can be entered. Hence, a query of the MBIM\_CID\_PIN command is needed prior to sending the set command. After the SIM is unlocked, the function must send a MBIM\_CID\_SUBSCRIBER\_READY\_STATUS event notification with ReadyState set to the SIM card's new state.

- If the SIM card is PUK1 locked but no unblock attempts remain, the ReadyState is set to MBIMSubscriberReadyStateBadSim. This state may be entered as soon as the SIM is initialized or after an unsuccessful unlock attempt of PUK1 in which case the ReadyState is changed from MBIMSubscriberReadyStateLocked to MBIMSubscriberReadyStateBadSim
- If there is no SIM card present, the ReadyState is MBIMSubscriberReadyStateNotInserted. If the SIM card is removed while the function is open and the function has the capability to detect a hot removal/insertion of a SIM card, a notification that the ReadyState has changed to MBIMSubscriberReadyStateNotInserted shall be sent. The function shall send event notifications (1) if a new SIM card is inserted (with ReadyState set to MBIMSubscriberReadyStateNotInitialized); and (2) whenever new ReadyStates apply.
- If the function can detect that a SIM card is not activated, the ready state of an inactive SIM card
  is MBIMSubscriberReadyStateNotActivated. If the function supports service activation, and the
  host successfully sends the function a MBIM\_CID\_SERVICE\_ACTIVATION set request, on
  successful completion of service activation, the function shall send another event notification
  with updated ReadyState.
- If any failure of the SIM card has been detected, the ReadyState is MBIMSubscriberReadyStateFailure

#### Query:

No input parameters, so InformationBuffer on Query message is not used.

MBIM\_SUBSCRIBER\_READY\_INFO returned in the InformationBuffer of MBIM\_COMMAND\_DONE.

#### Set:

Not applicable.

#### **Unsolicited Event:**

The Event InformationBuffer contains an MBIM\_SUBSCRIBER\_READY\_INFO structure.

Functions must report all ready-state changes as an unsolicited event. When the function initializes it sets MBIMSubscriberReadyStateNotInitialized. Thereafter, the function must report any ready-state change to the host through this notification. For example, the function must report a ready-state change when the state changes from MBIMSubscriberReadyStateNotInitialized to

Mobile Broadband Interface Model

MBIMSubscriberReadyStateDeviceLocked, or MBIMSubscriberReadyStateBadSim, or MBIMSubscriberReadyStateSimNotInserted, or any other different function ready-state.

Most ready-state changes happen when the function initializes the radio stack and the SIM card (if required). A change can also happen during the course of a session between the host and the function, such as user changing the SIM card.

#### 10.5.2.3 DATA STRUCTURES

## Table 10-16: MBIM\_SUBSCRIBER\_READY\_STATE

Types	Value	Description
MBIMSubscriberReadyStateNotInitialized	0	The SIM has not yet completed its initialization
MBIMSubscriberReadyStateInitialized	1	The SIM is initialized. When this state is reported all the subscriber fields in Table 10-18: MBIM_SUBSCRIBER_READY_INFO must be valid.
MBIMSubscriberReadyStateSimNotInserted	2	The SIM card is not inserted into the device
MBIMSubscriberReadyStateBadSim	3	The SIM card inserted into the device is invalid
MBIMSubscriberReadyStateFailure	4	A general SIM failure has occurred
MBIMSubscriberReadyStateNotActivated	5	The subscription is not activated

	Mobile Broadband Interface Model	
82		November 14, 2011

MBIMSubscriberReadyStateDeviceLocked		The SIM is locked and requires PIN1 or PUK1
	6	to unlock

## Table 10-17: MBIM\_UNIQUE\_ID\_FLAGS

Types	Value	Description
MBIMReadyInfoFlagsNone	0	The device is in normal mode
MBIMReadyInfoFlagsProtectUniqueID	1	When this flag is specified, the host will not display the SubscriberId specified in the same CID.

### 10.5.2.4 QUERY

The InformationBuffer shall be null and InformationBufferLength shall be zero

### **10.5.2.5 RESPONSE**

The following structure shall be used in the InformationBuffer

## Table 10-18: MBIM\_SUBSCRIBER\_READY\_INFO

Offset	Size	Field	Туре	Description
0	4	ReadyState	MBIM_SUBSCRIBER_RE ADY_STATE	One of the values in Table 10-16:  MBIM_SUBSCRIBER_READY_STATE

4	4	SubscriberIdOffset	OFFSET	Offset in bytes, calculated from the beginning of this structure, to a string SubscriberId of digits that represents the identity of the subscriber.  For GSM-based functions, this member represents the International Mobile Subscriber Identity (IMSI) string (up to 15 digits in length).  For CDMA-based functions, this represents the Mobile Identification Number (MIN) string or the International Roaming MIN (IRM) string (both 10 digits in length).  For single-carrier multi-mode functions, the GSM SubscriberId format must be used. This does not apply to multi-carrier multi-mode functions as the SubscriberId may change.
				The function must provide a valid SubscriberId when the device ready-state changes to MBIMSubscriberReadyStateInitialize d. Functions should also specify this string when the device ready-state changes to MBIMSubscriberReadyStateBadSim, MBIMSubscriberReadyStateFailure, or MBIMSubscriberReadyStateDeviceLo cked, if possible, for identification purposes.
8	4	SubscriberIdSize	SIZE (030)	Sized used for the SubscriberId

The InformationBuffer shall be null and InformationBufferLength shall be zero

#### 10.5.3.6 **RESPONSE**

The following structure shall be used in the InformationBuffer

Table 10-22: MBIM\_RADIO\_STATE\_INFO

Offset	Size	Field	Туре	Description
0	4	HwRadioState	MBIM_RADIO_SWITCH_STATE	The state of the W_DISABLE switch (see Section 3.2.5.2 of [PCI-Express]). If the device does not have a W_DISABLE switch The function must return MBIMRadioOn in this field. See Table 10-20: MBIM_RADIO_SWITCH_STATE
4	4	SwRadioState	MBIM_RADIO_SWITCH_STATE	Software configured radio state. See Table 10-20: MBIM_RADIO_SWITCH_STATE

### 10.5.3.7 NOTIFICATION

See Table 10-22: MBIM\_RADIO\_STATE\_INFO

#### **10.5.3.8 STATUS CODES**

This CID only uses Generic Status Codes (see Use of the Status Codes section 9.4.5).

### 10.5.4 MBIM\_CID\_PIN

### 10.5.4.1 DESCRIPTION

During the initialization process, the host does not proceed to registration until PIN1 is successfully unlocked, if enabled.

The host provides a PIN value, entered by the end user, in the Pin member of the MBIM\_SET\_PIN structure when processing set requests. The function must process the request only when the PIN value

00	Wobile Broadbarid interface Woder	November 14 2011
	Mobile Broadband Interface Model	

matches the value stored in the SIM card. Otherwise, functions must fail the set request with status code MBIM\_STATUS\_FAILURE.

CDMA-based devices must report the power-on device lock as PIN1.

For multi-mode functions, the PIN operations for a given mode must be supported even when operating in a different mode.

For all supported PIN types, functions must support the MBIMPinOperationEnter operation. Additionally, if PIN1 is supported, functions must support the MBIMPinOperationEnable, MBIMPinOperationDisable, and MBIMPinOperationChange operations.

If a PIN disable operation for a PIN type is tried when that PIN type is locked, functions can either fail the request with MBIM\_STATUS\_PIN\_REQUIRED or they can successfully complete the request. If the function completes the request successfully, the disable operation must also unlock the PIN.

If reporting multiple PINs is enabled, and only one PIN can be reported at a time, then functions must report PIN1 first. For example, if reporting of Subsidy lock and SIM PIN1 is enabled, then the Subsidy lock PIN should be reported (in a subsequent query request) only after PIN1 has been successfully verified.

#### Query and Set:

For **Query**, the InformationBuffer is empty. For **Set**, it contains an MBIM\_SET\_PIN.

MBIM\_PIN\_INFO is returned with both Set Complete and Query Complete messages in the InformationBuffer.

MBIMPinTypeNetworkSubsetPin	7	The network subset personalization key
MBIMPinTypeServiceProviderPin	8	The service provider (SP) personalization key
MBIMPinTypeCorporatePin	9	The corporate personalization key
MBIMPinTypeSubsidyLock	10	The subsidy unlock key
MBIMPinTypePuk1	11	The Personal Identification Number1 Unlock
		Key (PUK1).
MBIMPinTypePuk2	12	The Personal Identification Number2 Unlock
		Key (PUK2
MBIMPinTypeDeviceFirstSimPuk	13	The device to very first SIM PIN unlock key
MBIMPinTypeNetworkPuk	14	The network personalization unlock key
MBIMPinTypeNetworkSubsetPuk	15	The network subset personalization unlock
		key
MBIMPinTypeServiceProviderPuk	16	The service provider (SP) personalization
		unlock key
MBIMPinTypeCorporatePuk	17	The corporate personalization unlock key

## Table 10-25: MBIM\_PIN\_STATE

Types	Value	Description
MBIMPinStateUnlocked	0	The device does not require a PIN
MBIMPinStateLocked	1	The device requires the user to enter a PIN

## Table 10-26: MBIM\_PIN\_OPERATION

Types	Value	Description
MBIMPinOperationEnter	0	Enter the specified PIN into the device.
MBIMPinOperationEnable	1	Enable the specified PIN
MBIMPinOperationDisable	2	Disable the specified PIN
MBIMPinOperationChange	3	Change the specified PIN

### 10.5.4.4 SET

The following structure shall be used in the InformationBuffer

	Mobile Broadband Interface Model	
90		November 14, 2011

Table 10-27: MBIM\_SET\_PIN

Offset	Size	Field	Туре	Description
0	4	PinType	MBIM_PIN_TYPE	See Table 10-24: MBIM_PIN_TYPE
4	4	PinOperation	MBIM_PIN_OPERATION	See Table 10-26:
				MBIM_PIN_OPERATION
8	4	PinOffset	OFFSET	Offset in bytes, calculated from the
				beginning of this structure, to a string
				Pin that represents the PIN value to
				perform the action with, or the PIN
				value required to enable/disable PIN
				settings. This member applies for all
				values of PinOperation.
12	4	PinSize	SIZE (032)	Size in bytes used for the Pin
16	4	NewPinOffset	OFFSET	Offset in bytes, calculated from the
				beginning of this structure, to a string
				NewPin that represents the new PIN
				value to set when PinOperation is
				MBIMPinOperationChange or
				MBIMPinOperationEnter for
				PinTypeMBIMPinTypePuk1 or
				MBIMPinTypePuk2.

24		DataBuffer	DATABUFFER	Pin
				NewPin

## 10.5.4.5 QUERY

The InformationBuffer shall be null and InformationBufferLength shall be zero

### **10.5.4.6 RESPONSE**

The following structure shall be used in the InformationBuffer

## Table 10-28: MBIM\_PIN\_INFO

Offset	Size	Field	Туре	Description

Mobile Broadband Interface Model

0	4	PinType	MBIM_PIN_TYPE	See Table 10-24: MBIM_PIN_TYPE
4	4	PinState	MBIM_PIN_STATE	See Table 10-25: MBIM_PIN_STATE
8	4	RemainingAttempts	UINT32	Number of remaining attempts for any pin-related operations such as enter, enable, disable. Devices that do not support this information must set this member to 0xffffffff

#### **10.5.4.7 STATUS CODES**

#### Table 10-29: Status codes

Status code	Description
MBIM_STATUS_PIN_DISABLED	The operation failed because the PIN is disabled.
MBIM_STATUS_PIN_REQUIRED	The operation failed because a PIN must be entered to proceed.
MBIM_STATUS_NO_DEVICE_SUPPORT	The operation failed because a set on a corresponding PIN type is not supported by the device.

### 10.5.5 MBIM\_CID\_PIN\_LIST

#### 10.5.5.1 DESCRIPTION

This command returns a list of all the different types of Personal Identification Numbers (PINs) that are supported by the MB device and additional details for each PIN type, such as the length of the PIN (minimum and maximum lengths), PIN format, PIN-entry mode (enabled/disabled/not-available). This CID also specifies the current mode of each PIN supported by the function.

Functions must report all the PINs they support. This applies to multi-mode devices as well. However, multi-mode single carrier devices must report a single PIN1.

A PIN reported as PIN1 must comply with PIN1 guidelines: for CDMA-based devices this is a PIN that provides power-on verification or identification functionality, and for GSM-based devices this is a Subscriber Identity Module (SIM) PIN.

	Mobile Broadband Interface Model	
92		November 14, 2011

Functions must be able to return this information when the ready-state changes to MBIMSubscriberReadyStateInitialized or when the ready-state is MBIMSubscriberReadyStateDeviceLocked (PIN locked). Functions should also return this information in other ready-states, wherever possible.

### Query only:

InformationBuffer of Query message is empty. InformationBuffer of MBIM\_COMMAND\_DONE contains an MBIM\_PIN\_LIST\_INFO.

### 10.5.5.2 PARAMETERS

12	4	Dint ongth May	UINT32	not available.  The maximum number of
12	4	PinLengthMax	OINTSZ	characters in the PIN. Devices
				should not specify a value that is
				greater than 16. Devices should
				specify 0xffffffff, if the PIN length is
				not available.

## 10.5.5.4 QUERY

The InformationBuffer shall be null and InformationBufferLength shall be zero

### 10.5.5.5 **RESPONSE**

The following structure shall be used in the InformationBuffer

Table 10-34: MBIM\_PIN\_LIST\_INFO

Offset	Size	Field	Туре	Description
0	16	PinDescPin1	MBIM_PIN_DESC	MBIM_PIN_DESC structure describing PIN1. For GSM- based devices, this is a Subscriber Identity Module (SIM) PIN. For CDMA-based devices, power-on device lock is reported as PIN1

	Mobile Broadband Interface Model	
94		November 14, 2011

16	16	PinDescPin2	MBIM_PIN_DESC	MBIM_PIN_DESC structure describing PIN2. This is a SIM PIN2 that protects certain SIM functionality.
32	16	PinDescDeviceSimPin	MBIM_PIN_DESC	MBIM_PIN_DESC structure describing the device-to-SIM-card PIN. This is a PIN that locks the device to a specific SIM.
48	16	PinDescDeviceFirstSimPin	MBIM_PIN_DESC	MBIM_PIN_DESC structure describing device-to-very-first-SIM-card PIN. This is a PIN that locks the device to the very first inserted SIM.
64	16	PinDescNetworkPin	MBIM_PIN_DESC	MBIM_PIN_DESC structure describing the network personalization PIN. This is a PIN that allows the device to be personalized to a network. For more information about this PIN type, see section 22.022 of the 3GPP specification.
80	16	PinDescNetworkSubsetPin	MBIM_PIN_DESC	MBIM_PIN_DESC structure describing the network subset personalization PIN. This is a PIN that allows the device to be personalized to a subset of a network. For more information about this PIN type, see section 22.022 of the 3GPP specification.

# Mobile Broadband Interface Model

96	16	PinDescServiceProviderPin	MBIM_PIN_DESC	MBIM_PIN_DESC structure describing the Service Provider (SP) personalization PIN. This is a PIN that allows the device to be personalized to a service provider. For more information about this PIN type, see section 22.022 of the 3GPP specification
112	16	PinDescCorporatePin	MBIM_PIN_DESC	MBIM_PIN_DESC structure describing the corporate personalization PIN. This is a PIN that allows the device to be personalized to a specific company. For more information about this PIN type, see section 22.022 of the 3GPP specification.
128	16	PinDescSubsidyLock	MBIM_PIN_DESC	MBIM_PIN_DESC structure describing the subsidy unlocks PIN. This is a PIN that allows the device to be restricted to operate on a specific network. For more information about this PIN type, see section 22.022 of the 3GPP specification
144	16	PinDescCustom	MBIM_PIN_DESC	MBIM_PIN_DESC structure describing the custom PIN. This is a custom vendor-defined PIN type. It is not included in the above list

## **10.5.5.6 STATUS CODES**

	Mobile Broadband Interface Model	
06		November 14 2011

#### **10.5.5.7 STATUS CODES**

Status code	Description
MBIM_STATUS_PIN_REQUIRED	The PIN list operation failed because a PIN must be entered
	before this operation can proceed.

### 10.5.6 MBIM\_CID\_HOME\_PROVIDER

#### 10.5.6.1 DESCRIPTION

This command sets or returns information about the home provider of the cellular service subscription. For GSM-based devices and CDMA-based device with U-RIM, this information should be stored on the Subscriber Identity Module (SIM card). For CDMA-based devices without U-RIM, this information should be stored in auxiliary device memory.

### **Query and Set:**

InformationBuffer of **Query** message is empty. InformationBuffer of MBIM\_COMMAND\_ DONE contains an MBIM\_PROVIDER. If the device does not report MBIM\_CTRL\_CAPS\_MULTI\_CARRIER, this CID only supports **Query** unless the device reports MBIM\_CTRL\_CAPS\_MULTI\_CARRIER. If so, this CID may also be **Set**. The InformationBuffer of a **Set** message contains an MBIM\_ PROVIDER structure. Once set, the device must select the specified providers as its home provider, including reporting it to on a query of this CID.

The following bitmap table (Table 10-36: MBIM\_PROVIDER\_STATE) represents the various states with which the network provider's entry can be tagged. It shows the possible values that a function should specify (one or more values can be specified). Some values in this table apply only to specific CIDs. The "Relevant Commands" column shows the associations between the different CIDs and the relevant states.

#### 10.5.6.2 PARAMETERS

#### Table 10-35: Parameters

	Set	Query	Notification
Command	MBIM_PROVIDER	Empty	NA
Response	MBIM_PROVIDER	MBIM_PROVIDER	NA

N	Nobile Broadband Interface Model

## 10.5.6.3 DATA STRUCTURES

## Table 10-36: MBIM\_PROVIDER\_STATE

Types	Value	Description	Relevant Commands
MBIM_PROVIDER_STATE_U NKNOWN	Oh	The network provider state is unknown	
MBIM_PROVIDER_STATE_H OME	1h	The network provider is a home operator	MBIM_CID_HOME_PROVIDER,  MBIM_CID_ VISIBLE_PROVIDERS
MBIM_PROVIDER_STATE_F ORBIDDEN	2h	The network provider is on the blocked list	MBIM_CID_PREFERRED_PROVIDERS,  MBIM_CID_ VISIBLE_PROVIDERS
MBIM_PROVIDER_STATE_P REFERRED	4h	The network provider is on the preferred list	MBIM_CID_PREFERRED_PROVIDERS,  MBIM_CID_ VISIBLE_PROVIDERS
MBIM_PROVIDER_STATE_V ISIBLE	8h	The network provider is visible	MBIM_CID_ VISIBLE_PROVIDERS
MBIM_PROVIDER_STATE_R EGISTERED	10h	The network provider is currently registered by the device	MBIM_CID_ VISIBLE_PROVIDERS
MBIM_PROVIDER_STATE_P REFERRED_MULTICARRIER	20h	The network provider is a preferred multicarrier network.	MBIM_CID_MULTICARRIER_PROVIDERS  MBIM_CID_ VISIBLE_PROVIDERS

## 10.5.6.4 SET

The following structure shall be used in the InformationBuffer

## Table 10-37: MBIM\_PROVIDER

Offset	Size	Field	Туре	Description

	Mobile Broadband Interface Model	
08		November 1/ 2011

0	4	ProviderIdOffset	OFFSET	Offset in bytes, calculated from the beginning (offset 0) of this MBIM_PROVIDER structure, to a numeric (0-9) string ProviderId that represents the network provider identity.
				For GSM-based networks, this string is a concatenation of a three-digit Mobile Country Code (MCC) and a two or three-digit Mobile Network Code (MNC). GSM-based carriers may have more than one MNC, and hence more than one Providerld. However, only one is expected to be used at any given point in time (e.g., as home provider).
				For CDMA-based networks, this string is a five-digit System ID (SID).  Generally a CDMA-based carrier has more than one SID. Typically, the carrier has one SID for each market, which is usually divided geographically within a nation by regulations, such as Metropolitan Statistical Areas (MSA) in the United States of America. Devices of CDMA-based devices must specify MBIM_CDMA_DEFAULT_PROVIDER_ID if this information is not available.
4	4	ProviderIdSize	SIZE (012)	Size used for the ProviderId
8	4	ProviderState	MBIM_PROVIDER_STATE	See Table 10-36: MBIM_PROVIDER_STATE. This state tracks whether the network provider is currently the home provider, a preferred provider, whether it's visible, etc.

# Mobile Broadband Interface Model

12	4	ProviderNameOffset	OFFSET	Offset in bytes, calculated from the beginning of this structure, to a string ProviderName that represents the network provider's name. This member is limited to, at most, 20 characters.
				For GSM-based networks, if the Preferred Presentation of Country Initials and Mobile Network Name (PPCI&N) is longer than 20 characters, the device should abbreviate the network name.
				This member is ignored when the Host sets the preferred provider list.
				Note: This is not the long version (256 characters maximum) but the short version, so string length is short (limited to 20 characters or so by both 3GPP and 3GPP2).
16	4	ProviderNameSize	SIZE (040)	Size used for the ProviderName
20	4	CellularClass	MBIM_CELLULAR_CLASS	The cellular class that the provider uses. See Table 10-8:  MBIM_CELLULAR_CLASS. A device that supports  MBIM_CTRL_CAPS_MULTI_CARRIER must correctly populate this field for any provider that is currently visible. This field must be valid for any SET requests. Devices that do not support MBIM_CTRL_CAPS_MULTI_CARRIER should set this field to zero.

Mobile	Broadband	Interf	ace	Mode

24	4	Rssi	UINT32	Represents the strength of the wireless signal (when available). See Table 10-58:  MBIM_SIGNAL_STATE_INFO. A device that supports  MBIM_CTRL_CAPS_MULTI_CARRIER must correctly populate this field for any provider that is currently visible. This field should be ignored on set requests. Devices that do not support MBIM_CTRL_CAPS_MULTI_CARRIER should set this field to zero.
28	4	ErrorRate	UINT32	A coded value that represents a percentage range of error rates. See Table 10-58:  MBIM_SIGNAL_STATE_INFO. A devices that supports  MBIM_CTRL_CAPS_MULTI_CARRIER must correctly populate this field for any provider that is currently visible. This field should be ignored on set requests. Devices that do not support MBIM_CTRL_CAPS_MULTI_CARRIER should set this field to zero.
32		DataBuffer	DATABUFFER	ProviderId ProviderName

## 10.5.6.5 QUERY

The InformationBuffer shall be null and InformationBufferLength shall be zero

## **10.5.6.6 RESPONSE**

See Table 10-37: MBIM\_PROVIDER

## **10.5.6.7 STATUS CODES**

Status code	Description
MBIM_STATUS_READ_FAILURE	Home provider operation failed because the information could not be read from the device or SIM card. The error may be returned in instances where the SIM card does not have home provider information provisioned.

Mobile Broadband Interface Model

#### 10.5.7 MBIM\_CID\_PREFERRED\_PROVIDERS

#### 10.5.7.1 DESCRIPTION

This command returns information about the list of preferred providers for GSM-based devices. CDMA-based devices do not need to support this command.

### **Set and Query:**

For **Query**, the InformationBuffer is empty, for **Set**, it contains an MBIM\_PROVIDERS structure. **Set** can only operate on user-controlled entries, if such a list is available. If user-controlled entries are available, a **Set** replaces them with the list passed in the MBIM\_PROVIDERS structure. For functions that do not support user-controlled entries, a **Set** results in the error status, MBIM\_STATUS\_OPERATION\_NOT\_ALLOWED.

An MBIM\_PROVIDERS structure is returned from both **Set** and **Query** complete messages in the InformationBuffer, and in it, the function returns to the host all entries found. Thus, the list of entries returned by the function includes both the operator list as well as, whenever available, the user-controlled list.

#### **Unsolicited Event:**

The Event InformationBuffer contains an MBIM\_PROVIDERS structure.

In some cases, the PPL (for GSM-based devices) is updated by the network either Over-The-Air (OTA) or by Short Message Service (SMS). When this happens devices must notify the HOST about the updates using this INDICATION with the updated PPL

#### 10.5.7.2 PARAMETERS

#### Table 10-38: Parameters

	Set	Query	Notification
Comma nd	MBIM_PROVIDERS	Empty	NA
Respon se	MBIM_PROVIDERS	MBIM_PROVIDERS	MBIM_PROVIDERS

### 10.5.7.3 SET

The following structure shall be used in the InformationBuffer

### Table 10-39: MBIM\_PROVIDERS

Offset	Size	Field	Туре	Description

	Mobile Broadband Interface Model	
102		November 14, 2011

0	4	ElementCount (EC)	UINT32	Number of structures that follow.
4	8*EC	ProvidersRefList	OL_PAIR_LIST	The first element of the pair is a 4 byte Offset in bytes, calculated from the beginning (offset 0) of this MBIM_PROVIDERS structure, to an MBIM_PROVIDER structure (see Table 10-37: MBIM_PROVIDER).  The second element of the pair is a 4 byte size of the record element.
4+8*EC		DataBuffer	DATABUFFER	MBIM_PROVIDER

#### 10.5.7.4 **QUERY**

The InformationBuffer shall be null and InformationBufferLength shall be zero

See Table 10-39: MBIM\_PROVIDERS

### **10.5.7.7 STATUS CODES**

Status code	Description
MBIM_STATUS_READ_FAILURE	Reading information from device or SIM card, or both, failed. For example, the SIM card does not have preferred providers information provisioned.
MBIM_STATUS_OPERATION_NOT_ALLOWED	A Set was attempted on a preferred provider that is not settable (e.g., because it may have come from an operator-controlled list or whatever reason).

	Mobile Broadband Interface Model	
November 14 2011		103

November 14, 2011

### 10.5.8 MBIM\_CID\_VISIBLE\_PROVIDERS

#### 10.5.8.1 DESCRIPTION

This command returns a list of network providers currently visible within the MB device's range.

For CDMA-based networks, device should return only the home provider, if any of the networks in the Preferred Roaming List (PRL) is currently visible. For GSM-based networks, more than one provider may be present in the visible provider list.

Devices that do not support scanning for visible providers while connected should return the MBIM\_STATUS\_BUSY error value in the Status member.

Both GSM-based and CDMA-based devices must support scanning for visible providers while in registered mode. However, devices are not required to support scanning for visible provider while a Packet Data Protocol (PDP) context is active (for example, the device is connected to the provider's network).

### **Query Only:**

The InformationBuffer of the MBIM\_COMMAND\_MSG contains an MBIM\_VISIBLE\_PROVIDERS\_REQ structure (see Table 10-42: MBIM\_VISIBLE\_PROVIDERS\_REQ). InformationBuffer of MBIM\_COMMAND\_DONE contains an MBIM\_PROVIDERS structure (see Table 10-39: MBIM\_PROVIDERS)

#### 10.5.8.2 PARAMETERS

#### Table 10-40: Parameters

MBIMVisibleProvidersActionFullScan	0	Device should perform a full scan.

	Mobile Broadband Interface Model	
104		November 14 2011

MBIMV is ible Providers Action Restricted Scan	1	Device should perform a restricted scan to
		locate preferred multicarrier
		providers. The device may also report a
		static list in case a scan is not possible.

#### 10.5.8.4 QUERY

The following structure shall be used in the InformationBuffer

### Table 10-42: MBIM\_VISIBLE\_PROVIDERS\_REQ

Offset	Size	Field	Туре	Description
0	4	Action	MBIM_VISIBLE_PROVIDERS_ACTION	Defines which type of scan to perform.
				See Table 10-41:
				MBIM_VISIBLE_PROVIDERS_ACTION

#### 10.5.8.5 **RESPONSE**

See Table 10-39: MBIM\_PROVIDERS

#### **10.5.8.6 STATUS CODES**

Status code	Description
MBIM_STATUS_READ_FAILURE	Reading information from device or SIM card, or both, failed. For example, the SIM card does not have preferred providers information provisioned.

### 10.5.9 MBIM\_CID\_REGISTER\_STATE

### 10.5.9.1 DESCRIPTION

This command selects a network provider with which to register.

MBIM supports two registration methods: automatic and manual. For CDMA-based networks, MBIM supports only automatic registration.

Functions that support manual registration must set the ControlCaps member in MBIM\_DEVICE\_CAPS\_INFO (Table 10-14: MBIM\_DEVICE\_CAPS\_INFO) structure to MBIM\_CTRL\_CAPS\_REG\_MANUAL

If the registration state is automatic, functions select a network provider based on the selection algorithm specific to the cellular technology and proceed with registration.

Mobile Broad	band Interface Model

The semantics of RegisterAction values are defined as follows:

• The MBIMRegisterActionAutomatic flag is used by the Host to set the function to automatic registration mode, and to let the function select the best provider network. The function must ignore the ProviderId parameter. This setting is persistent across radio states (ON/OFF), and device power cycles, until it is explicitly change by the Host.

- The MBIMRegisterActionManual flag is used by the Host to instruct the function to register with
  the provider network identified by the ProviderId parameter. The ProviderId value shall come
  from the ProviderId member of MBIM\_PROVIDER data structure of one of the visible providers.
  This setting is persistent across radio states (ON/OFF), and device power cycles, until it is
  explicitly changed by the Host.
- Changing between the different RegisterAction values are allowed even if the device is currently registered to a provider. If the device need to deregister before switching between the Automatic and Manual registration modes, the device must ensure that the device is set to deregistration before setting to the new registration mode.
- The Manual and Automatic registration mode only affects the network selection mode. The MB device should try to register to selected network whenever the radio is turned on.
- When RegisterAction is set to MBIMRegisterActionManual, if the provider is not visible when
  the function receives the request, the function shall return error code
  MBIM\_STATUS\_PROVIDER\_NOT\_VISIBLE. The function must not switch to automatic
  registration because of a failure in setting the manual mode. If the function was earlier set to
  manually register to another network, this request should change the function to register to the
  network specified in the request. The value of RegisterState in response to the request should
  be set to MBIMRegisterStateDeregistered.
- When RegisterAction is set to MBIMRegisterActionManual, if the function has already registered with the same network that is being requested, it shall respond with MBIM\_STATUS\_SUCCESS.
- When RegisterAction is set to MBIMRegisterActionManual, and the Radio is OFF, the function
  must set itself to manual registration mode and complete the request with the transaction
  notification. The RegisterState should be set to MBIMRegisterStateDeregistered. The function
  must attempt a manual registration when the Radio changes to ON state and the event
  notification must be sent.
- When RegisterAction is set to MBIMRegisterActionAutomatic, and the Radio is OFF, the function
  must set itself to automatic registration mode and must complete the request with the
  transaction notification. The RegisterState should be set to MBIMRegisterStateDeregistered. The
  function must do an automatic registration when the Radio goes to ON state and the event
  notification must be sent.

### **Set and Query:**

MBIM\_REGISTRATION\_STATE\_INFO is returned from both **Set** and **Query** complete messages in the InformationBuffer.

For **Query**, the InformationBuffer is empty. For **Set**, it contains an MBIM\_SET\_REGISTRATION\_STATE structure.

Mobile	Broadband	Interface	Model
IVIODIIC	Dioaabana	michiacc	IVIOGOI

106 November 14, 2011

### **Unsolicited Event:**

The Event InformationBuffer contains an MBIM\_REGISTRATION\_STATE\_INFO structure.

### 10.5.9.2 PARAMETERS

Table 10-43: Parameters

	Set	Query	Notification
Command	MBIM_SET_REGISTRATION_STATE	Empty	NA
Response	MBIM_REGISTRATION_STATE_INFO	MBIM_REGISTRATION _STATE_INFO	MBIM_REGISTRATION_ST ATE_INFO

#### 10.5.9.3 DATA STRUCTURES

The following table shows registration, packet-attach, and packet-detach cause code failure values that are defined in the 3GPP TS 24.008 Specification for GSM-based network [3GPP24008]. These are to be reported back in NwError as appropriate, and as detailed in the NwError usage guidance throughout this specification.

Table 10-44: 3GPP TS 24.008 Cause codes for NwError

3GPP 24.008 Cause code	Interpretation of cause code
2 - International Mobile Subscriber Identity (IMSI) unknown in HLR	Either the SIM or the device is not activated, or the subscription has expired, which caused a network deactivation.
4 - IMSI unknown in VLR	Roaming feature is not subscribed to.
6 - Illegal ME	MS blocked by network due to stolen report.
7 - GPRS services not allowed	User does not have a GPRS subscription. User has only a voice connection subscription.
8 - GPRS and non-GPRS services not allowed	GPRS and non-GPRS services are not allowed.

Mobile Broadband Interface Model

11 - PLMN not allowed	Service is blocked by the network due to an expired subscription or another cause.
12 - Location area not allowed	User subscription does not allow access in the present location area.
13 - Roaming not allowed in this location area	The subscription permits roaming, but roaming is not allowed in the present location area.
14 - GPRS services not allowed in this PLMN	Selected network provider does not provide GPRS service to the MS.
15 - No suitable cells in location area	No subscription for the service.
17 - Network failure	Registration failed.
22 – Congestion	Registration failed due to network congestion.

For example, if the network initiates a deactivate context event because roaming is not allowed in the location area, functions should set the NwError member to 13 per the 3GPP TS 24.008 Cause codes for GSM-based networks [3GPP24008].

Similar logic should be applied to CDMA-based networks as well. However, there is no standard for CDMA-based network error codes. CDMA-based devices should use the network -specific or device-specific error codes.

#### Table 10-45: MBIM\_REGISTER\_ACTION

Types	Value
MBIMRegisterActionAutomatic	0
MBIMRegisterActionManual	1

### Table 10-46: MBIM\_REGISTER\_STATE

Types	Value
MBIMRegisterStateUnknown	0

	Mobile Broadband Interface Model	
108		November 14, 2011

MBIMRegisterStateDeregistered	1
MBIMRegisterStateSearching	2
MBIMRegisterStateHome	3
MBIMRegisterStateRoaming	4
MBIMRegisterStatePartner	5
MBIMRegisterStateDenied	6

If the device is registered with a roaming provider, the device shall set RegisterState as MBIMRegisterStatePartner if the provider is a preferred roaming partner or just MBIMRegisterStateRoaming for a roaming partner, respectively. If the device does not distinguish between the two, it shall set the value to MBIMRegisterStateRoaming.

Table 10-47: MBIM\_REGISTER\_MODE

Types	Value
UDTUD 1 1 M 1 M 1	
MBIMRegisterModeUnknown	0
MBIMRegisterModeAutomatic	1
MBIMRegisterModeManual	2

Table 10-48: MBIM\_REGISTRATION\_FLAGS is a bitmap that indicates network conditions related to auto-attach and manual network selection capabilities.

Table 10-48: MBIM\_REGISTRATION\_FLAGS

Types	Mask	Description
MBIM_REGISTRATION_NONE	0	No bits are set.
MBIM_REGISTRATION_MANUAL_SELECTION_NOT_AVAILABLE	1	If set, this bit indicates that the network currently does not support manual network selection. This can vary on a per-cell basis.

Mobile Broadband Interface Model	
	Ξ

MBIM_REGISTRATION_PACKET_SERVICE_AUTOMATIC_ATTACH	2	If set, this bit indicates
		that the function will
		auto-attach to the
		network after registration
		without involvement from
		the host.

If a function sets the MBIM\_REGISTRATION\_PACKET\_SERVICE\_AUTOMATIC\_ATTACH bit, it is expected to auto-attach to the provider network after registration without involvement by the host. The function will indicate the result to the host using an unsolicited Packet Service notification following the registration. Intermediate queries by the host will be answered by the device using the MBIMPacketServiceStateAttaching status. If the auto-attach fails, the function might not retry the attach procedure, in which case it will report the Packet Service status as MBIMPacketServiceStateDetached. Upon success, the function must report MBIMPacketServiceStateAttached. Prior to sending a MBIM CID CONNECT (MBIMActivationCommandActivate), the host will send a MBIM CID PACKET SERVICE (MBIMPacketServiceActionAttach) set request if the function has previously reported MBIMPacketServiceStateDetached. Conversely, after sending a MBIM\_CID\_CONNECT (MBIMActivationCommandDeactivate) the host does not send a set MBIM CID PACKET SERVICE (MBIMPacketServiceActionDetach). This mechanism allows the function to manage its own packet service detach state.

If a function does not set the MBIM\_REGISTRATION\_PACKET\_SERVICE\_AUTOMATIC\_ATTACH flag, then (1) prior to MBIM CID CONNECT (MBIMActivationCommandActivate) the host sends a set MBIM\_CID\_PACKET\_SERVICE (MBIMPacketServiceActionAttach), as long as the function is not already attached or attaching; and (2), the host issues an MBIMPacketServiceActionDetach following the MBIM\_CID\_CONNECT (MBIMActivationCommandDeactivate).

#### 10.5.9.4

The following structure shall be used in the InformationBuffer

#### Table 10-49: MBIM\_SET\_REGISTRATION\_STATE

Offset	Size	Field	Туре	Description

Mobile Broadband Interface Model November 14, 2011

0	4	ProviderIdOffset	OFFSET	Offset in bytes, calculated from the beginning of this structure, to a numeric (0-9) WCHAR string ProviderId that represents the network provider identity.  For GSM-based networks, this string is a concatenation of a three-digit Mobile Country Code (MCC) and a two or three-digit Mobile Network Code (MNC). GSM-based carriers may have more than one MNC, and hence more than one ProviderId.  For CDMA-based networks, this string is a five-digit System ID (SID).
4	4	ProviderIdSize	SIZE (0. 12)	Generally, a CDMA-based carrier has more than one SID. Typically, the carrier has one SID for each market, which is usually divided geographically within a nation by regulations, such as Metropolitan Statistical Areas (MSA) in the United States of America. Devices of CDMA-based devices must specify 0 if this information is not available.
4	4	ProviderIdSize	SIZE (012)	Size used for the ProviderId
8	4	RegisterAction	MBIM_REGISTER_ACTION	The registration action that the device is requested to perform. If this member is set to MBIMRegisterActionAutomatic, the ProviderId member should be ignored  See Table 10-45:  MBIM_REGISTER_ACTION

# Mobile Broadband Interface Model

12	4	DataClass	MBIM_DATA_CLASS	A bitmap that represents the data access technologies that are preferred for a connection. For a detailed list of values, see Table 10-11: MBIM_DATA_CLASS.  When multiple data-classes are set as preferred, devices are expected register to the highest available data-class technology that is currently visible. Devices should attempt to register the best available data-class as requested. If the device cannot register the data-class specified in this member, it should register the best available data-class.
16		DataBuffer	DATABUFFER	ProviderId

### 10.5.9.5 QUERY

The InformationBuffer shall be null and InformationBufferLength shall be zero

### **10.5.9.6 RESPONSE**

The following structure shall be used in the InformationBuffer

Table 10-50: MBIM\_REGISTRATION\_STATE\_INFO

Offset	Size	Field	Туре	Description
0	4	NwError	UINT32	A network-specific error. Table 10-44: 3GPP TS 24.008 Cause codes for NwError shows the connection failure values as documented in the Cause values in the appendixes of the 3GPP TS 24.008 Specification [3GPP24008].
4	4	RegisterState	MBIM_REGISTER_STATE	See Table 10-46: MBIM_REGISTER_STATE
8	4	RegisterMode	MBIM_REGISTER_MODE	See Table 10-47:

	Mobile Broadband Interface Model	
112		November 14, 2011

				MBIM_REGISTER_MODE
12	4	AvailableDataClasses	MBIM_DATA_CLASS	A bitmap of the values in Table 10-11: MBIM_DATA_CLASS that represent the supported data classes in the registered network, for the cell the device is registered in.  The value is set to MBIMDataClassNone as long as the RegisterState is not MBIMRegisterStateHome, MBIMRegisterStateRoaming or MBIMRegisterStatePartner.
16	4	CurrentCellularClass	MBIM_CELLULAR_CLASS	Indicates the current cellular class in use for a multi-mode function. See Table 10-8: MBIM_CELLULAR_CLASS. For a single-mode function this is the same as the cellular class reported in MBIM_CID_DEVICE_CAPS. For multi-mode functions, a transition from CDMA to GSM or vice versa is indicated with an updated CurrentCellularClass
20	4	ProviderIdOffset	OFFSET	Offset in bytes, calculated from the beginning of this structure, to a numeric (0-9) string ProviderId that represents the network provider identity.  For GSM-based networks, this string is a concatenation of a three-digit Mobile Country Code (MCC) and a two or three-digit Mobile Network Code (MNC). GSM-based carriers may have more than one MNC, and hence more than one ProviderId.

# Mobile Broadband Interface Model

For CDMA-based networks, this string is a five-digit System ID (SID). Generally, a CDMA-based carrier has more than one SID. Typically, a carrier has one SID for each market, which is usually divided geographically within a nation by regulations, such as Metropolitan Statistical Areas (MSA) in the United States of America. Devices of CDMA-based devices must specify MBIM\_CDMA\_DEFAULT\_PROVIDER\_ID if this information is not available.

When processing a query request, and the registration state is in automatic register mode, this member contains the provider ID that the device is currently associated with (if applicable). When the registration state is in manual register mode, this member contains the provider ID that the device is requested to register with (even if the provider is unavailable).

When processing a set request and the registration state is in manual mode, this contains the provider ID selected by the Host for the device to register with. When the registration state is in automatic register mode, this parameter is ignored.

to

MBIM\_CDMA\_DEFAULT\_PROVIDER\_
ID if the provider ID is not available

24	4	ProviderIdSize	SIZE (012)	Size used for ProviderId
28	4	ProviderNameOffset	OFFSET	Offset in bytes, calculated from the beginning of this structure, to a string ProviderName that represents the network provider's name. This member is limited to, at most, MBIM_PROVIDERNAME_LEN characters.  For GSM-based networks, if the Preferred Presentation of Country Initials and Mobile Network Name (PPCI&N) is longer than twenty characters, the device should abbreviate the network name.  This member is ignored when the Host sets the preferred provider list.  Devices should specify a NULL string for devices that do not have this information.
32	4	ProviderNameSize	SIZE (040)	Size used for ProviderName
36	4	RoamingTextOffset	OFFSET	Offset in bytes, calculated from the beginning of this structure, to a WCHAR string RoamingText to inform the user that the device is roaming. This member is limited to at most 63 characters.  This text should provide additional information to the user when the registration state is either MBIMRegisterStatePartner or MBIMRegisterStateRoaming. This member is optional.

# Mobile Broadband Interface Model

40	4	RoamingTextSize	SIZE (0126)	Size used for RoamingText
44	4	RegistrationFlag	MBIM_REGISTRATION_F LAGS	Flag set per Table 10-48:  MBIM_REGISTRATION_FLAGS.
48		DataBuffer	DATABUFFER	ProviderId ProviderName RoamingText

#### 10.5.9.7 NOTIFICATION

See Table 10-50: MBIM\_REGISTRATION\_STATE\_INFO

### **10.5.9.8 STATUS CODES**

The following table shows possible error status codes.

Status code	Description
MBIM_STATUS_PIN_REQUIRED	Device requires PIN value input.
MBIM_STATUS_FAILURE	Unable to get registration state.
MBIM_STATUS_NOT_INITIALIZED	The operation failed because the function is in the process of initializing. Retry the operation after the ready-state of the device changes to MBIMReadyStateInitialized.
MBIM_STATUS_BAD_SIM	The operation failed because a bad SIM card was detected.
MBIM_STATUS_SIM_NOT_INSERTED	The operation failed because the SIM card was not inserted fully into the device.

Functions can return the following error codes (in addition to the above listed) only in the event a session activation set operation fails.

Status code	Description
	Unable to set registration state. More information is specified in NwError (see Table 10-44: 3GPP TS 24.008 Cause codes for NwError). For other error codes, NwError should

	Mobile Broadband Interface Model	
116		November 14 2011

	be set to 0.
MBIM_STATUS_NO_DEVICE_SUPPORT	CDMA-based devices must return this error code, if a set registration request is for manual registration.
MBIM_STATUS_SERVICE_NOT_ACTIVATED	Service activation failed. Subscription expired. Device does not allow setting registration state.
MBIM_STATUS_PROVIDER_NOT_VISIBLE	Provider is not visible for registration. This is for manual registration.
MBIM_STATUS_INVALID_PARAMETERS	If the request is manual registration to a forbidden provider.
MBIM_STATUS_BUSY	The device is busy and unable to change the registration mode. This scenario can occur if the device does not permit changing the registration mode when a session is activated.

### 10.5.9.9 STATUS CODES FOR SET OPERATION

Status code	Description
MBIM_STATUS_SERVICE_NOT_ACTIVATED	Service activation failed. Subscription expired. Device does not allow setting registration state.
MBIM_STATUS_PROVIDER_NOT_VISIBLE	Provider is not visible for registration. This is for manual registration.
MBIM_STATUS_INVALID_PARAMETERS	If the request is manual registration to a forbidden provider.
MBIM_STATUS_BUSY	The device is busy and unable to change the registration mode. This scenario can occur if the device does not permit changing the registration mode when a PDP context is activated.

	Mobile Broadband Interface Model	
November 14 2011		117

#### 10.5.10 MBIM\_CID\_PACKET\_SERVICE

#### **10.5.10.1 DESCRIPTION**

This command is used to instruct devices to perform packet service attach or detach actions on the current registered provider's network for both GSM-based and CDMA-based MB devices. In addition to the packet service attach/detach status, this CID is used to determine data class availability, the currently used data class information, and the uplink and downlink speeds.

Note: This CID is not about IP (v4 or v6) connectivity. The host may use this CID to determine if it will be able to obtain IP service, or to prepare for it.

CDMA-based devices should use this as an opportunity to release the network resource allocation if possible.

Some SIM cards enable the MB device to register only on the packet domain and not the circuit-switched domain. Once a data call ends, the host sends an MBIM\_CID\_PACKET\_SERVICE set request to detach packet service. This causes the MB device to detach from the packet domain. The MB device unregisters from the network and goes into a power save mode.

Devices should send MBIM\_STATUS\_PACKET\_SERVICE unsolicited events. Devices should fail PDP activation if the device packet service state is not set to MBIMPacketServiceStateAttached.

The function can expect the host not to proceed with context activation until the packet service state has reached MBIMPacketServiceStateAttached.

The values for UplinkSpeed and DownlinkSpeed are expected to be nominal speeds, and are not expected to reflect actual throughput, goodput or any other such precise values. These speed values are analogous to the nominal speeds in other networking technologies, like "11 Mbps" in IEEE 802.11 or "100 Mbps" in IEEE 802.3. Nevertheless, these values may change. If so, the function must use the unsolicited event to notify the host.

Note: Uplink and downlink are the 3gpp definitions which not is the same as the upstream/downstream in the [USB20] and [USB30] specifications.

Functions use the MBIMPacketServiceStateAttaching and MBIMPacketServiceStateDetaching transient states only when responding to query requests or in unsolicited events. Functions must not return these transient states in MBIM\_COMMAND\_DONE for Set request. Functions must only send MBIM\_COMMAND\_DONE for Set request after they have successfully completed a packet service attach or detach, or detected an error.

#### **Set and Query:**

118

MBIM\_PACKET\_SERVICE\_INFO is returned from both **Set** and **Query** complete messages in the InformationBuffer.

	November 14 2011
Mobile Broadband Interface Model	

For **Query**, the InformationBuffer is empty. For **Set**, it contains an MBIM\_SET\_PACKET\_SERVICE.

### **Unsolicited Event:**

The Event InformationBuffer contains an MBIM\_PACKET\_SERVICE\_INFO structure.

8	4	HighestAvailableDataC	MBIM_DATA_CLASS	The highest available data
		lass		class in the current cell,
				specified according to Table
				10-11: MBIM_DATA_CLASS.
				Functions must set this
				member to
				MBIMDataClassNone as long
				as the function is not in
				packet service state attached.
				packet service state attached.
				Except for HSPA (i.e., HSUPA
				and HSDPA), the function sets
				this member to a single
				MBIM_DATA_CLASS value.
				For HSPA data services,
				functions specify a bit-wise
				OR of
				MBIM_DATA_CLASS_HSDPA
				and
				MBIM_DATA_CLASS_HSUPA.
				For cells that support HSDPA
				but not HSUPA, only HSDPA is
				indicated (implying UMTS
				data class for uplink data).
				The highest available data
				class may not be indicated by
				the cell at packet attach, but
				may become known first
				when a context is activated.
				Whenever the highest
				available data class changes,
				functions shall send a
				notification indicating the
				new value of
				HighestAvailableDataClass.
				-

# Mobile Broadband Interface Model

12	8	UplinkSpeed	UINT64	Contains the uplink bit rate, in
				bits per second.
20	8	DownlinkSpeed	UINT64	Contains the downlink bit
				rate, in bits per second.

### **10.5.10.7 NOTIFICATION**

See Table 10-55: MBIM\_PACKET\_SERVICE\_INFO

### **10.5.10.8 STATUS CODES**

Status code	Description
MBIM_STATUS_FAILURE	Packet-attach or packet-detach has failed. More information is set at NwError member of MBIM_PACKET_SERVICE_INFO structure (see Table 10-44: 3GPP TS 24.008 Cause codes for NwError). For other MBIM_STATUS_ERROR values, NwError should be set to zero.
MBIM_STATUS_SERVICE_NOT_ACTIVATED	The device does not allow setting packet service state because of service activation failure or expired subscription.
MBIM_STATUS_PROVIDER_NOT_VISIBLE	Provider is not visible for packet service operations.
MBIM_STATUS_NOT_REGISTERED	The device is not in registered state to perform a packet- attach operation.
MBIM_STATUS_NO_DEVICE_SUPPORT	SET packet service is not supported by this CDMA-based device.
MBIM_STATUS_RADIO_POWER_OFF	Unable to packet-attach because the radio is turned off.

## 10.5.11 MBIM\_CID\_SIGNAL\_STATE

### **10.5.11.1 DESCRIPTION**

This command returns or sets the current signal state.

On a set request from the Host, devices should:

	Mobile Broadband Interface Model	
122		November 14, 2011

 Return the current values for Rssi and ErrorRate in the MBIM\_SIGNAL\_STATE\_INFO structure in addition to reporting the absolute values for SignalStrengthInterval, RssiThreshold and ErrorRateThreshold that has been set in the device.

- Internally cache the SignalStrengthInterval and/or RssiThreshold values even if the device is not currently registered with any operator and that any restriction imposed by device in setting parameters can only be possible post-registration state. The device should try to apply these settings in the next immediate available situation.
- Complete the request successfully, if the hardware and/or software radio switch state is currently OFF. Device cache the request data and start reporting the signal strength after the switch is turned ON.
- Can fail this request with the appropriate Status error code set.

Devices can do the following when processing query requests from the Host:

- Return the current values for Rssi and ErrorRate in the MBIM\_SIGNAL\_STATE\_INFO structure in addition to reporting the absolute values for SignalStrengthInterval and RssiThreshold that has been set in the device.
- Fail this request with the appropriate Status error code set.

#### **Query and Set:**

MBIM\_SIGNAL\_STATE\_INFO is returned from both **Set** and **Query** complete messages in the InformationBuffer.

For **Query**, the InformationBuffer is empty. For **Set**, it contains an MBIM\_SET\_SIGNAL\_STATE.

#### **Unsolicited Event:**

The Event InformationBuffer contains an MBIM\_SIGNAL\_STATE\_INFO structure.

Devices must notify the HOST if the Rssi value changes by at least +/-5 decibels from the last reported value, or at a maximum frequency of one indication every 5 seconds. The threshold value is specified in the RssiThreshold field of Table 10-58: MBIM\_SIGNAL\_STATE\_INFO; while the maximum frequency value is specified in the SignalStrengthInterval field of Table 10-58: MBIM\_SIGNAL\_STATE\_INFO.

The CellularClass field of the Table 10-14: MBIM\_DEVICE\_CAPS\_INFO structure controls how the Rssi value will be interpreted by the Host. If CellularClass is MBIMCellularClassGSM, Rssi is reported as decibels above the device's sensitivity noise floor. If CellularClass is MBIMCellularClassCDMA, Rssi is reported as compensated RSSI (accounts for noise). In the case of multi-mode devices, Rssi uses GSM reporting format with appropriate translation.

#### Mobile Broadband Interface Model

#### **10.5.11.2 PARAMETERS**

Table 10-56: Parameters

MODILE	BIOAC	เกลกด	inienace	IVIOCIEI

12	4	RssiThreshold	UINT32	The difference in RSSI coded values that trigger a report.
16	4	ErrorRateThreshold	UINT32	The difference in ErrorRate coded values that trigger a report. Use 0xffffffff for, do not care.

#### **10.5.11.6 NOTIFICATION**

See Table 10-58: MBIM\_SIGNAL\_STATE\_INFO.

#### **10.5.11.7 STATUS CODES**

This CID only uses Generic Status Codes (see Use of the Status Codes section 9.4.5).

#### 10.5.12 MBIM CID CONNECT

#### 10.5.12.1 DESCRIPTION

126

This command activates or deactivates a particular IP data stream session and reads the activation state of a session. The set operation requests an IP data stream session (to a specific APN) to be made available to the host. The function may already have an IP data stream session to the APN on the radio interface. In that case the function shall make this IP data stream available to the host. If no IP data stream exists on the radio interface, the function shall try to establish it to the requested APN on the radio interface and make it available to the host.

The device must send appropriate event notifications whenever the activation state changes.

The **Set** command can succeed only if the device is in a register state of MBIMRegisterStateHome, MBIMRegisterStatePartner, or MBIMRegisterStateRoaming. When packet service is active, the device must also be in an attach state of MBIMPacketServiceStateAttached.

Functions make IP data stream sessions available to the host only as instructed by it. Once a function has indicated an IP data stream session as unavailable to the host, the function must not automatically make the IP data stream session available again to the host. If the access string is not provided in the MBIM\_CID\_CONNECT request, the function shall try to set up an IP data stream session to the network's default APN. If the function already has an active session to the network, it may choose to make it available to the host. A multi-mode single-carrier function should use the ActivationCommand parameters for GSM even when connecting to the network in CDMA coverage area. IP connectivity must be maintained across the handoff if IP configuration doesn't change.

The function may deactivate an IP data stream session independently of the Host. This may occur when network connectivity has been lost for a period that exceeds the threshold of temporary loss of signal, or as part of a graceful shutdown or state cleanup. On Set requests, the Host Provides both SessionId and ActivationCommand parameters in the MBIM\_CONNECT\_INFO data structure. It instructs the device to activate or deactivate an IP data streamidentified by SessionId, based on the

ActivationCommand parameter value MBIMActivationCommandActivate or MBIMActivationCommandDeactivate.

If the service or subscription requires activation, the device should return error code
 MBIM\_STATUS\_SERVICE\_NOT\_ACTIVATED. The session activation may not happen until the
 service or subscription is activated. All the emergency services might be available subject to the
 support from the device and the operator. The operating system might call the
 MBIM\_SET\_SERVICE\_ACTIVATION in response to this error code.

- If the device receives an IP data stream session activation request while its maximum number of IP data streams is currently activated, it returns error code
   MBIM STATUS MAX ACTIVATED CONTEXTS.
- If the device receives a context deactivation request but the context identified by SessionId is not currently activated, it returns error code MBIM\_STATUS\_CONTEXT\_NOT\_ACTIVATED.

The device uses the following logic to determine the validity of AccessString, UserName, and Password settings from a set request:

• If ActivationCommand is MBIMActivationCommandDeactivate, the device should ignore the settings of these three parameters. The rest of the cases only consider the case when ActivationCommand is MBIMActivationCommandActivate.

On a **Set** request, the Host may specify an IP type to activate. If MBIMContextIPTypeDefault is specified, the host does not care what IP type is activated. If a value other than MBIMContextIPTypeDefault is specified, the device must only activate that context. When activated, the device must return the appropriate IPType in response to a query request.

Functions use the MBIMActivationStateActivating and MBIMActivationStateDeactivating transient states only when responding to **Query** requests or in **Unsolicited Events**. Functions must not return these transient states in MBIM\_COMMAND\_DONE for **Set** request. Functions must only send MBIM\_COMMAND\_DONE for **Set** request after they have successfully activated or deactivated an IP data stream session, or detected an error.

Functions use the MBIMActivationStateActivated state to signal to the host that the link is up, and that it is now okay to use this IP data stream.

If the function receives a **Set** request for this CID for a given SessionId while processing another **Set** request for this CID for that same SessionId, the function shall fail the second **Set** request by returning MBIM\_STATUS\_BUSY, and continue processing the original **Set** request.

On **Query** requests, the Host uses this object to find out the activation state.

#### Mobile Broadband Interface Model

#### **Query and Set:**

For **Query**, the InformationBuffer contains an MBIM\_CONNECT\_INFO in which the only relevant field is the SessionId. The SessionId in a **Query** indicates which IP data stream's connect information is to be returned by the function. For **Set**, the InformationBuffer contains an MBIM\_SET\_CONNECT.

MBIM\_CONNECT\_INFO is returned from both **Set** and **Query** complete messages in the InformationBuffer.

#### **Unsolicited Event:**

The Event InformationBuffer contains an MBIM\_CONNECT\_INFO structure.

The function must also notify the host when changes in context state are caused unrelated to a **Set** request from the host. For example, the function must notify the host if the network deactivates a context. The function must issue an **Unsolicited Event** to notify the host about any such applicable context state changes (i.e., any changes that can be expressed via Table 10-68: MBIM\_CONNECT\_INFO).

Functions that support separate voice and data connections must follow these guidelines:

- At the time of initialization, the VoiceCallState must be set to MBIMVoiceCallStateNone.
- On the start of the voice call, send an event notification with VoiceCallState set to MBIMVoiceCallStateInProgress. All the other members must reflect their current state. In case of no active connection during the voice call, the SessionId should be set to "0".

Once the voice call is completed, send an event notification with VoiceCallState set to MBIMVoiceCallStateHangUp. All the other members must reflect their current state. In case of no active connection during the voice call hang up, the SessionId should be set to "0".

**10.5.12.4 SET** The following structure shall be used in the InformationBuffer

# Table 10-67: MBIM\_SET\_CONNECT

Offset	Size	Field	Туре	Description
0	4	SessionId	UINT32	Host specifies this member to uniquely identify the session for the IP data stream and its corresponding state.
				Device must use the value in this member when completing set requests. The Host uses the value in this member in subsequent query requests as well as disconnect requests to the device. The value shall also be used as an identifier on the data transport.
				The function can reject the request if the host uses a SessionId that exceeds MaxSessions-1, where MaxSessions is in Table 10-14: MBIM_DEVICE_CAPS_INFO
				Informative note: It is expected that hosts will use
		Mo	bile Broadband Interfa	ace Model

				0 for the Internet connection.
				Valid values range from 0 to MaxSessions-1.
4	4	ActivationCommand	MBIM_ACTIVATION_COMMAND	See Table 10-60:
				MBIM_ACTIVATION_COMM AND
8	4	AccessStringOffset	OFFSET	Offset in bytes, calculated from the beginning of this structure, to a string AccessString to access the network. For GSM-based networks, this would be an Access Point Name (APN) string such as "data.thephone-company.com". For CDMA-based networks, this might be a special dial code such as "#777" or a Network Access Identifier (NAI) such as "foo@thephone-company.com". This member can be NULL, to request that the network assign the default APN.
				NOTE: Not all networks support this NULL APN convention, so a connect failure due to an invalid APN is a possible outcome.
				The size of the string should not exceed 100 characters.
12	4	AccessStringSize	SIZE (0200)	Size used for AccessString
16	4	UserNameOffset	OFFSET	Offset in bytes, calculated from the beginning of this structure, to a string UserName that represents the username to authenticate. This member

N	
ce Model	Mobile Broadband Interface Model

### **10.5.12.6 RESPONSE**

The following structure shall be used in the InformationBuffer

Table 10-68: MBIM\_CONNECT\_INFO

Offset	Size	Field	Туре	Description
0	4	SessionId	UINT32	The Host specifies a value for this member at the time of the connect request by using MBIM_CID_CONNECT. Devices must copy this value and use it when they notify the MB Service on subsequent connection state changes.
4	4	ActivationState	MBIM_ACTIVATION_STATE	See Table 10-64: MBIM_ACTIVATION_STATE
8	4	VoiceCallState	MBIM_VOICE_CALL_STATE	See Table 10-65:  MBIM_VOICE_CALL_STATE
12	4	ІРТуре	MBIM_CONTEXT_IP_TYPE	See Table 10-63: MBIM_CONTEXT_IP_TYPE
16	16	ContextType	MBIM_CONTEXT_TYPES	Specifies the type of context being represented, for example, Internet connectivity, VPN (a connection to a corporate network), or Voice-over-IP (VOIP). Devices should specify MBIMContextTypeNone for empty or unprovisioned contexts.  See Table 10-66: MBIM_CONTEXT_TYPES
32	4	NwError	UINT32	A network-specific error. Table 10-44: 3GPP TS 24.008 Cause codes for NwError shows the connection failure values as documented in the Cause values in the appendixes of the 3GPP TS 24.008 Specification [3GPP24008].

### **10.5.12.7 NOTIFICATION**

See Table 10-68: MBIM\_CONNECT\_INFO

	Mobile Broadband Interface Model	
13/		November 14 2011

### **10.5.12.8 STATUS CODES**

Status code	Description
MBIM_STATUS_SUCCESS	The operation succeeded. Functions can return this value if the context has already been activated.
MBIM_STATUS_RADIO_POWER_OFF	The operation failed because the radio is currently turned off. This error code should be returned only in response to a MBIM_CID_CONNECT set request. If the radio state is off then the function should respond to MBIM_CID_CONNECT query requests with MBIM_STATUS_SUCCESS and specify the current context state as MBIMActivationStateDeactivated.
MBIM_STATUS_SERVICE_NOT_ACTIVATE D	The operation failed because either the subscription has expired, or the device does not allow PDP activation.
MBIM_STATUS_PROVIDER_NOT_VISIBLE	The operation failed because the service provider is not currently visible.
MBIM_STATUS_MAX_ACTIVATED_CONTE XTS	The operation failed because the maximum number of activated contexts has been reached.
MBIM_STATUS_INVALID_ACCESS_STRING	The operation failed because the access string is invalid.
MBIM_STATUS_INVALID_USER_NAME_P WD	The operation failed because the user name and/or password supplied are invalid. Network specific error code may be available in NwError (see Table 10-44: 3GPP TS 24.008 Cause codes for ).
MBIM_STATUS_PACKET_SERVICE_DETAC HED	The operation failed because packet service is detached.
MBIM_STATUS_NOT_REGISTERED	The operation failed because the device is not in the registered state to perform PDP activation.

Mobile Broadband Interface Model	
- MODILE DIOAGOANG INTERIACE MOGEL	

MBIM_STATUS_VOICE_CALL_IN_PROGRE	The operation failed and cannot proceed with PDP
SS	activation because a voice call is currently in progress. This value applies only to devices with voice class is set to MBIMVoiceClassSeparateVoiceData.
MBIM_STATUS_CONTEXT_NOT_ACTIVATE D	The operation failed because the context identified by SessionId is not the currently activated context.

#### 10.5.13 MBIM\_CID\_PROVISIONED\_CONTEXTS

#### **10.5.13.1 DESCRIPTION**

This command reads or updates the provisioned context entries stored on the MB device or the Subscriber Identity Module (SIM).

Functions should return MBIM\_STATUS\_NOT\_SUPPORTED if the MB device they support does not support retrieval of provisioned contexts.

GSM-based functions must support query and set operations. CDMA-based devices must support query operations reporting Simple IP (MBIM\_CTRL\_CAPS\_CDMA\_SIMPLE\_IP).

The provisioned context entries stored on the MB device or the SIM are local to the device

Provisioned contexts are the connectivity parameters (AccessString, UserName, and Password) that are either pre-provisioned by the Operators or OTA provisioned by the device and can be stored either in the device memory or SIM. The connectivity parameters returned by the Provisioned contexts will be used by the Host for PDP activation.

The list of provisioned contexts must be restricted only to the home provider network even though the device may have the capability to store multiple network provider contexts. The context list must always be the home provider network specific even in case of roaming.

The SET MBIM\_CID\_PROVISIONED\_CONTEXT operation should associate the context with the network provider that is specified in the set request in the ProviderId field of Table 10-71: MBIM\_SET\_PROVISIONED\_CONTEXT. Provisioned context stored through set MBIM\_CID\_PROVISIONED\_CONTEXT requests must persist across system restarts and device power cycles.

CDMA devices that are configured for SimpleIP, reporting MBIM\_CTRL\_CAPS\_CDMA\_SIMPLE\_IP in ControlCaps must always return at least one provisioned context filled with the correct AccessString, UserName, and Password members for the query request from Host.

	Mobile Broadband Interface Model	
136		November 14, 2011

Provisioned context list should be pre-provisioned in the device. Host-initiated updates are accomplished via MBIM\_CID\_PROVISIONED\_CONTEXT operations; the device shall not heed any updates attempted via the MBIM\_CID\_CONNECT operation. Updates, initiated by either the device or the operator, are also possible (for example, using SMS or OTA).

#### **Query and Set:**

MBIM\_PROVISIONED\_CONTEXTS\_INFO is returned from both **Query** and **Set** complete messages in the InformationBuffer.

For Query, the InformationBuffer is empty. For Set, it contains an MBIM\_SET\_PROVISIONED\_CONTEXT.

#### **Unsolicited Event:**

The Event InformationBuffer contains an MBIM\_PROVISIONED\_CONTEXTS\_INFO structure.

In some cases, the list of provisioned contexts is updated by the network either Over-The-Air (OTA) or by Short Message Service (SMS). The function must update the list of provisioned contexts accordingly. Thereafter, functions must notify the Host about the updates using this event with the updated list.

#### **10.5.13.2 PARAMETERS**

#### Table 10-69: Parameters

	Set	Query	Notification
Command	MBIM_SET_PROVISIONED_CONTEXT	Empty	NA
Response	MBIM_PROVISIONED_CONTEXTS_INFO	MBIM_PROVISIONED_ CONTEXTS_INFO	MBIM_PROVISIONED _CONTEXTS_INFO

#### 10.5.13.3 DATA STRUCTURES

#### Table 10-70: MBIM\_CONTEXT

Offset	Size	Field	Type	Description

0	4	ContextId	UINT32	A unique ID for this context.
				For set  MBIM_CID_PROVISIONED_CONTEXT requests, the Host can set the value to MBIM_CONTEXT_ID_APPEND. If this value is used, the device should decide the index for storing the context information.  MBIM_CONTEXT_ID_APPEND should never be returned in response to query MBIM_CID_PROVISIONED_CONTEXT requests.
4	16	ContextType	MBIM_CONTEXT_TYPES	Specifies the type of context being represented, for example, Internet connectivity, VPN (a connection to a corporate network), or Voice-over-IP (VOIP). Devices should specify MBIMContextTypeNone for empty or unprovisioned contexts. See Table 10-66: MBIM_CONTEXT_TYPES

20	4	AccessStringOffset	OFFSET	Offset in data buffer to a string AccessString to access the network. For GSM-based networks, this would be an Access Point Name (APN) string such as "data.thephone- company.com". For CDMA-based networks, this might be a special dial code such as "#777" or a Network Access Identifier (NAI) such as "foo@thephone-company.com". This member can be NULL, to request that the network assign the default APN.  NOTE: Not all networks support this NULL APN convention, so a connect failure due to an invalid APN is a possible outcome.
				The size of the string should not exceed 100 characters.
24	4	AccessStringSize	SIZE (0200)	Size used for AccessString
28	4	UserNameOffset	OFFSET	Offset in bytes, calculated from the beginning of this structure, to a string UserName that represents the username to authenticate. This member can be NULL.
32	4	UserNameSize	SIZE (0510)	Size used for UserName
36	4	PasswordOffset	OFFSET	Offset in bytes, calculated from the beginning of this structure, to a string Password that represents the username's password. This member can be NULL.
40	4	PasswordSize	SIZE (0510)	Size used for Password

Mahila	Broadband	Interface	Modo
MODILE	Bioaobano	inienace	WICH

44	4	Compression	MBIM_COMPRESSION	Specifies the compression to be used in the data connection for header and data. This member applies only to GSM-based devices. The Host sets this member to MBIMCompressionNone for CDMA-based devices. See Table 10-61: MBIM_COMPRESSION
48	4	AuthProtocol	MBIM_AUTH_PROTOCOL	Authentication type to use for the PDP activation. See Table 10-62: MBIM_AUTH_PROTOCOL
52		DataBuffer	DATABUFFER	AccessString UserName Password

# **10.5.13.4 SET** The following structure shall be used in the InformationBuffer

# Table 10-71: MBIM\_SET\_PROVISIONED\_CONTEXT

Offset	Size	Field	Туре	Description
0	4	ContextId	UINT32	A unique ID for this context.
				For set  MBIM_CID_PROVISIONED_CONTEXT requests, the Host can set the value to MBIM_CONTEXT_ID_APPEND. If this value is used, the device should decide the index for storing the context information.  MBIM_CONTEXT_ID_APPEND should never be returned in response to query MBIM_CID_PROVISIONED_CONTEXT requests.

	Mobile Broadband Interface Model	
140		November 14, 2011

4	16	ContextType	MBIM_CONTEXT_TYPES	Specifies the type of context being represented, for example, Internet connectivity, VPN (a connection to a corporate network), or Voice-over-IP (VOIP), etc. Devices should specify MBIMContextTypeNone for empty or unprovisioned contexts. See Table 10-66: MBIM_CONTEXT_TYPES
20	4	AccessStringOffset	OFFSET	Offset in bytes, calculated from the beginning of this structure, to a string AccessString to access the network. For GSM-based networks, this would be an Access Point Name (APN) string such as "data.thephone-company.com". For CDMA-based networks, this might be a special dial code such as "#777" or a Network Access Identifier (NAI) such as "foo@thephone-company.com". This member can be NULL, to request that the network assign the default APN.  NOTE: Not all networks support this NULL APN convention, so a connect failure due to an invalid APN is a possible outcome.  The size of the string should not exceed 100 characters.
24	4	AccessStringSize	SIZE (0200)	Size used for AccessString
28	4	UserNameOffset	OFFSET	Offset in bytes, calculated from the beginning of this structure, to a string UserName that represents the username to authenticate. This member can be NULL.
32	4	UserNameSize	SIZE (0510)	Size used for UserName

N A . 1 '1 .	D II			N.A I. I
MODILE	Broadb	and int	ertace	Model

36	4	PasswordOffset	OFFSET	Offset in bytes, calculated from the beginning of this structure, to a string Password that represents the username's password. This member can be NULL.
40	4	PasswordSize	SIZE (0510)	Size used for Password
44	4	Compression	MBIM_COMPRESSION	Specifies the compression to be used in the data connection for header and data. This member applies only to GSM-based devices. The Host sets this member to MBIMCompressionNone for CDMA-based devices. See Table 10-61: MBIM_COMPRESSION
48	4	AuthProtocol	MBIM_AUTH_PROTOCOL	Authentication type to use for the PDP activation. See Table 10-62: MBIM_AUTH_PROTOCOL
52	4	ProviderIdOffset	OFFSET	Offset in bytes, calculated from the beginning of this structure, to a string ProviderId that represents the network provider identification for which the provisioned context should be stored in set MBIM_CID_PROVISIONED_CONTEXT requests. Devices should return the added provisioned context in response to subsequent query operations when a Subscriber Identity Module (SIM card) with this home provider ID is in the device.
56	4	ProviderIdSize	SIZE (012)	Size used for ProviderId
60		DataBuffer	DATABUFFER	AccessString UserName Password ProviderId

### 10.5.13.5 QUERY

The InformationBuffer shall be null and InformationBufferLength shall be zero

### 10.5.13.6 RESPONSE

The following structure shall be used in the InformationBuffer

Table 10-72: MBIM\_PROVISIONED\_CONTEXTS\_INFO

Offset	Size	Field	Туре	Description
0	4	ElementCount (EC)	UINT32	Count of MBIM_CONTEXT structures that follow in the DataBuffer
4	8*EC	ProvisionedContextRefList	OL_PAIR_LIST	The first element of the pair is a 4 byte Offset in bytes, calculated from the beginning (offset 0) of this MBIM_PROVISIONED_CONTEXTS_INFO structure, to an MBIM_CONTEXT structure (see Table 10-70: MBIM_CONTEXT).  The second element of the pair is a 4 byte size of the corresponding MBIM_CONTEXT structure.
4+8*EC		DataBuffer	DATABUFFER	Array of MBIM_CONTEXT structures

#### **10.5.13.7 NOTIFICATION**

See Table 10-72: MBIM\_PROVISIONED\_CONTEXTS\_INFO

#### **10.5.13.8 STATUS CODES**

For Query and Set Operations

Status code	Description
MBIM_STATUS_INVALID_PARAMETERS	The operation failed because of invalid parameters.

Mobile Broadband Int	erface Model

MBIM_STATUS_READ_FAILURE	The operation failed because the device was unable to get
	provisioned contexts.

### For Set Operations Only

Status code	Description
MBIM_STATUS_WRITE_FAILURE	The operation failed because the update request was unsuccessful.

## 10.5.14 MBIM\_CID\_SERVICE\_ACTIVATION

#### **10.5.14.1 DESCRIPTION**

This command instructs devices to initiate service activation in order to gain access to the provider's network.

## Set only:

InformationBuffer of MBIM\_COMMAND\_MSG contains an MBIM\_SET\_SERVICE\_ACTIVATION.

The InformationBuffer of MBIM COMMAND DONE contains an MBIM SERVICE ACTIVATION INFO.

### 10.5.14.1.1 SERVICE ACTIVATION DETECTION

Hosts can determine whether they must perform service activation in a couple of ways:

- For CDMA-based devices, in North America or other places where U-RIM is not used, there should be a flag on the device to indicate activation status. CDMA Devices should be able to detect the activation status during initialization without contacting the provider network. Devices should perform service activation automatically when the device first connects overthe-air to the home network. After activation has been completed, devices should clear the flag so that they will not need to perform service activation again.
- The function can inform the host about service activation progress by sending
   MBIM\_CID\_SUBSCRIBER\_READY\_STATUS notifications during MB device initialization.
   Alternatively, to determine service activation status, the host may send an
   MBIM\_CID\_SUBSCRIBER\_READY\_STATUS query request to the function. In both cases, the
   initial ready-state should be MBIMSubscriberReadyStateNotActivated. After service has been
   activated, devices shall resume the initialization process and notify the host as the device ready state changes.

	Mobile Broadband Interface Model	
144		November 14 2011

• For GSM-based devices, there is no general method to detect whether a device must have its service activated. Devices can implement their own proprietary method, specific to its carrier, to perform service detection and activation.

#### 10.5.14.1.2 SERVICE ACTIVATION

Service activation refers to the process of activating the MB service subscription so that the device can gain access to the provider's network. Service activation can be automatic, or manual, or a combination of both. Hosts need to perform service activation only once for each new subscription. For a multimode capable function, service activation is performed only once for the subscription across all modes.

#### **10.5.14.2 PARAMETERS**

#### Table 10-73: Parameters

	Set	Query	Notification
Command	MBIM_SET_SERVICE_ACTIVATION	NA	NA
Response	MBIM_SERVICE_ACTIVATION_INFO	NA	NA

#### 10.5.14.3 SET

Since the service activation data varies across carriers, VendorSpecificBuffer is a placeholder for sending the carrier-specific data to activate the service.

# Table 10-74: MBIM\_SET\_SERVICE\_ACTIVATION

Offset	Size	Field	Туре	Description
0	Х	DataBuffer	DATABUFFER	VendorSpecificBuffer

#### 10.5.14.4 RESPONSE

## Table 10-75: MBIM\_SERVICE\_ACTIVATION\_INFO

Offset	Size	Field	Туре	Description
0	4	NwError	UINT32	A network-specific error. Table 10-44: 3GPP TS 24.008 Cause codes for NwError shows the connection failure values as documented in the Cause

Mobile Broadband Interface Model

				values in the appendixes of the 3GPP TS 24.008 Specification [3GPP24008].
4	Х	DataBuffer	DATABUFFER	VendorSpecificBuffer

## **10.5.14.5 STATUS CODES**

Status code	Description
MBIM_STATUS_INVALID_PARAMETERS	Service activation failed because of invalid parameters.
MBIM_STATUS_FAILURE	Service activation failed. Device can return this value if service has already been activated.
MBIM_STATUS_PROVIDER_NOT_VISIBLE	Service activation failed because the service provider is not currently visible.

#### 10.5.15 MBIM\_CID\_SMS\_CONFIGURATION

## **10.5.15.1 DESCRIPTION**

This command indicates the state of the SMS storage and also sets or returns a MB device's SMS text message configuration.

### **Query and Set:**

GSM-based functions should support both **Query** and **Set** operations. CDMA-based functions should support only **Query** operations. CDMA-based functions should return a valid value in the MaxMessages member of the MBIM\_SMS\_CONFIGURATION\_INFO structure for **Query** requests and can ignore the other members.

MBIM\_SMS\_CONFIGURATION\_INFO is returned from both **Query** and **Set** complete messages in the InformationBuffer. If the SmsStorageState is MBIMSmsStorageNotInitialized, the fields other than SmsStorageState are not valid and may be set to arbitrary values by the function.

For **Query**, the InformationBuffer is empty. For **Set**, it contains an MBIM\_SET\_SMS\_CONFIGURATION.

#### **Unsolicited Event:**

The **Unsolicited Event** is sent at any time the state of the SMS storage changes. The Event InformationBuffer contains an MBIM\_SMS\_CONFIGURATION\_INFO structure.

	Mobile Broadband Interface Model	
146		November 14, 2011

The function must return MBIM\_STATUS\_NOT\_INITIALIZED for **Set** requests if the device is initialized but the SMS subsystem is not yet initialized.

The function must return MBIM\_STATUS\_NOT\_SUPPORTED if it does not support configuring SMS text messages.

#### **10.5.15.2 PARAMETERS**

Table 10-76: Parameters

	Set	Query	Notification
Command	MBIM_SET_SMS_CONFIGURATION	Empty	NA
Response	MBIM_SMS_CONFIGURATION_INFO	MBIM_SMS_CONFIGURATION _INFO	MBIM_SMS_CON FIGURATION_INF O

#### 10.5.15.3 DATA STRUCTURES

Table 10-77: MBIM\_SMS\_STORAGE\_STATE

Types	Value
MBIMSmsStorageNotInitialized	0
MBIMSmsStorageInitialized	1

A multi-mode single-carrier function must use only GSM PDU format (MBIMSmsFormatPdu) even if the underlying cellular technology switches from GSM to CDMA, and must provide the appropriate transcoding in the send and receive paths. This applies to both PDU and CDMA text formats.

Table 10-78: MBIM\_SMS\_FORMAT

Types	Value
MBIMSmsFormatPdu	0
MBIMSmsFormatCdma	1

#### 10.5.15.4 SET

The following structure shall be used in the InformationBuffer

ľ	Nobile Broadband Interface Model

Table 10-79: MBIM\_SET\_SMS\_CONFIGURATION

Offset	Size	Field	Туре	Description
0	4	Format	MBIM_SMS_FORMAT	See Table 10-78: MBIM_SMS_FORMAT
4	4	ScAddressOffset	OFFSET	Offset in bytes, calculated from the beginning of this structure, to a string ScAddress with a maximum length of 20 digits that represents the Service Center (SC) address. This member is used by all text messages for sending and receiving. For PDU-style SMS messages, this information is used if it is not available in PDU data.  The number can be in any of the following formats:  "+ <international code="" country=""> <sms center="" number="" service="">"  "<sms center="" number="" service="">"</sms></sms></international>
8	4	ScAddressSize	SIZE (040)	For set requests, the Host can set this member to zero to indicate that the device does not need to update ScAddress and should not update this member thereafter. In this case, the ScAddressSize must also be set to zero.  Size of ScAddress. If ScAddressOffset is set to zero ScAddressSize must also be set to
				zero.
12		DataBuffer	DATABUFFER	ScAddress

# 10.5.15.5 QUERY

The InformationBuffer shall be null and InformationBufferLength shall be zero

# 10.5.15.6 **RESPONSE**

The following structure shall be used in the InformationBuffer

	Mobile Broadband Interface Model	
148		November 14, 2011

# Table 10-80: MBIM\_SMS\_CONFIGURATION\_INFO

Offset	Size	Field	Туре	Description
0	4	SmsStorageState	MBIM_SMS_STORAGE_S TATE	The current state of the SMS storage according to Table 10-77: MBIM_SMS_STORAGE_STATE
4	4	Format	MBIM_SMS_FORMAT	See Table 10-78: MBIM_SMS_FORMAT
8	4	MaxMessages	UINT32	The maximum number of messages that can be stored on the device
12	4	CdmaShortMessageSize	UINT32	The maximum SMS character length that is supported by the device, if the device is CDMA-based. This member does not apply to GSM-based devices. GSM-based devices shall specify 0.  CDMA-based devices that support SMS should specify their carrier-specific maximum SMS character length to be greater than 0. The value could possibly be larger than 160 if Enhanced Messaging Service (EMS) is supported. Otherwise, it is expected to be less than 160.  CDMA-based devices that do not support SMS should set this member to 0.

# Mobile Broadband Interface Model

16	4	ScAddressOffset	OFFSET  Offset in bytes, calculated from the beginning of this structure to a string ScAddress with a maximum length of 20 digits represents the Service Center (SC) address. This member is used by all text messages for sending and receiving. For Postyle SMS messages, this information is used if it is not available in PDU data.  The number can be in any of following formats:	
				"+ <international code="" country=""> <sms center="" number="" service="">" "<sms center="" number="" service="">"</sms></sms></international>

MBIM_STATUS_SMS_UNKNOWN_SMSC_ ADDRESS	The operation failed because the SMSC address is unknown or invalid.

	Mobile Broadband Interface Model	
150		November 14, 2011

#### 10.5.16 MBIM\_CID\_SMS\_READ

#### **10.5.16.1 DESCRIPTION**

This command reads SMS text messages stored in the MB device, or Subscriber Identity Module (SIM card), or any other auxiliary non-volatile memory or memories.

MBIM\_CID\_SMS\_READ supports reading both PDU-mode and CDMA-mode SMS text messages, depending on the capabilities of the function.

Functions may receive requests to read SMS text messages based on an index, or to read all SMS text messages. Read requests may consist of any one of the basic filters such as new (unread) messages, old (read) messages, draft messages, or sent messages.

Functions that implement SMS text message functionality must support the reading of all messages using the basic filter for MBIMSmsFlagAll and all new messages using the basic filter for MBIMSmsFlagNew. All other filter types are optional to support.

Functions must logically project a single SMS text message store across all available physically different SMS text message stores.

#### Query:

The InformationBuffer of the MBIM\_COMMAND\_MSG contains an MBIM\_SMS\_READ\_REQ structure.

The InformationBuffer of the MBIM\_COMMAND\_DONE message contains an MBIM\_SMS\_READ\_INFO structure.

#### **Unsolicited Event:**

The Event InformationBuffer contains an MBIM\_SMS\_READ\_INFO structure.

The function sends this event in the case of the arrival of a new class-0 (flash/alert) message from the network provider as an event notification.

#### **10.5.16.2 PARAMETERS**

				MBIM_SMS_CONFIGURATION_INFO. Be aware that the specification does not differentiate between physically available data stores. If the message is a Class 0 (flash/alert) message, this must be set to 0.
4	4	MessageStatus	MBIM_SMS_MESSAGE_STA TUS	See Table 10-85:  MBIM_SMS_MESSAGE_STATUS
8	4	AddressOffset	OFFSET	Offset in bytes, calculated from the beginning of this structure, to a string Address with a maximum length of 20 digits that represents a mobile number. The number can be in any of the following formats:  • "+ <international code="" country=""> &lt; Mobile Number&gt;" • "<mobile number="">" If MsgStatus is MBIMSmsStatusDraft or MBIMSmsStatusSent, devices should specify the receiver's mobile number in the previous members. Otherwise, if MsgStatus is MBIMSmsStatusNew or MBIMSmsStatusOld, devices should specify the sender's mobile number.</mobile></international>
12	4	AddressSize	SIZE (040)	Size used for Address
16	4	TimeStampOffset	OFFSET	Offset in bytes, calculated from the beginning of this structure, to a string TimeStamp with a maximum length of 21 that represents the Service Center (SC) timestamp, in the following format: " YY/ MM/ DD, HH: mm: SS± ZZ" where:  • YY represents the last two digits of the year. For example, 07

Mobile Broadband Interface Model

corresponds to 2007. Valid range is between 00 and 99.

- MM represents the month index in double digits. For example, 01 for January and 12 corresponds to December. Valid range is between 01 and 12.
- DD represents the day of the month in double digits. For example, 01 corresponds to the 1st day of the month, and 31 corresponds to the 31st day. Valid range is between 01 and 31.
- HH represents the hours in 24-hour format. For example, 01 corresponds to 1 AM and 13 corresponds to 1PM. Valid range is between 00 and 23.
- mm represents the minutes in double digits. For example, 01 corresponds to 1 minute and 30 corresponds to 30 minutes.
   Valid range is between 00 and 59.
- SS represents the seconds in double digits. For example, 01 corresponds to 1 second and 30 corresponds to 30 seconds.
   Valid range is between 00 and 59.
- ZZ represents the time zone with reference to Greenwich Mean Time (GMT). For example, 01 corresponds to 1 hour and 12 corresponds to 12 hours. Valid range is between 00 and 13 (-12 to +13 when combined with the ± symbol).

For example, to represent October 2nd, 1996, 20:01:54 GMT+2 hours use the following string timestamp "96/10/02,20:01:54+02"

MBIM_STATUS_INVALID_MEMORY_INDEX	The operation failed because of an invalid memory index.
MBIM_STATUS_FILTER_NOT_SUPPORTED	The operation failed because the filter type is not supported.

# 10.5.17 MBIM\_CID\_SMS\_SEND

# **10.5.17.1 DESCRIPTION**

This command sends SMS text messages to another device capable of receiving SMS.

MBIM\_CID\_SMS\_SEND supports sending both PDU-mode and CDMA-mode SMS text messages, depending on the capabilities of the function.

GSM-based functions are expected to support only PDU-mode SMS text messages. CDMA-based functions can support PDU-mode or CDMA-mode SMS text messages. Functions must be able to complete **Set** requests regardless of SMS text message mode.

## Set only:

The InformationBuffer of the MBIM\_COMMAND\_MSG contains an MBIM\_SET\_SMS\_SEND structure.

Mobi	e Broadband Interface Model

The InformationBuffer of the MBIM\_COMMAND\_DONE message contains an MBIM\_SMS\_SEND\_INFO structure.

# 10.5.17.6 STATUS CODES

Status code	Description
MBIM_STATUS_SMS_NETWORK_TIMEOUT	The SMS operation failed because of a network timeout.
MBIM_STATUS_SMS_LANG_NOT_SUPPORTED	The SMS operation failed because the SMS language is not supported. This applies to CDMA based devices only.
MBIM_STATUS_SMS_ENCODING_NOT_SUPPORTED	The SMS operation failed because the SMS encoding is not supported. This applies to CDMA based device only.
MBIM_STATUS_SMS_FORMAT_NOT_SUPPORTED	The operation failed because the SMS format specified in MBIM_SMS_CONFIGURATION_INFO is not supported.
MBIM_STATUS_MEMORY_FAILURE	The operation failed because the because of device or SIM memory failure.

	Mobile Broadband Interface Model	
164		November 14, 2011

MBIM_STATUS_SMS_UNKNOWN_SMSC_ADDRESS	The SMS operation failed because the service
	center address is either invalid or unknown.

# 10.5.18 MBIM\_CID\_SMS\_DELETE

## **10.5.18.1 DESCRIPTION**

This command deletes SMS text messages stored in the MB device, or Subscriber Identity Module (SIM card), or any other auxiliary non-volatile memory or memories.

Functions may receive requests to delete SMS text messages based on an index, or to delete all SMS text messages. Delete requests may consist of any one of the basic filters such as new (unread) messages, old (read) messages, draft messages, or sent messages.

## Set only:

InformationBuffer for MBIM\_COMMAND\_MSG contains MBIM\_SET\_SMS\_DELETE.

InformationBuffer for MBIM\_COMMAND\_DONE is not used.

#### **10.5.18.2 PARAMETERS**

#### **Table 10-95: Parameters**

	Set	Query	Notification
Command	MBIM_SET_SMS_DELETE	NA	NA
Response	Empty	NA	NA

#### 10.5.18.3 DATA STRUCTURES

## 10.5.18.4 SET

The following structure shall be used in the InformationBuffer

## Table 10-96: MBIM\_SET\_SMS\_DELETE

0	4	Flags	MBIM_SMS_FLAG	See Table 10-82: MBIM_SMS_FLAG

Mohila	<b>Broadha</b>	nd Interface	Mode
1/10/11/11	DIUAUUA	no intenace	

4	4	MessageIndex	UINT32	A value between 1 and
				MaxMessages that is an index into
				the device's message store.
				This value in this member is valid
				only if Flag is set to
				MBIMSmsFlagIndex. The Host sets
				this member if Flag is set to
				MBIMSmsFlagIndex. For all flags
				other than MBIMSmsFlagIndex, the
				Host sets this index to 0.

## 10.5.18.5 **RESPONSE**

The InformationBuffer shall be null and InformationBufferLength shall be zero

## 10.5.18.6 STATUS CODES

Status code	Description
MBIM_STATUS_MEMORY_FAILURE	The operation failed because the because of device or SIM memory failure.
MBIM_STATUS_INVALID_MEMORY_INDEX	The operation failed because of an invalid memory index.
MBIM_STATUS_FILTER_NOT_SUPPORTED	The operation failed because the filter type is not supported.

# 10.5.19 MBIM\_CID\_SMS\_MESSAGE\_STORE\_STATUS

# **10.5.19.1 DESCRIPTION**

This command reports the status of the MB device's message store.

# Query:

InformationBuffer in MBIM\_COMMAND\_MSG is empty. InformationBuffer in MBIM\_COMMAND\_DONE contains MBIM\_SMS\_STATUS\_INFO.

#### **Unsolicited Event:**

The Event InformationBuffer contains an MBIM\_SMS\_STATUS\_INFO structure.

The function sends this event to inform the Host about the arrival of all non-class-0 (flash/alert) messages.

	Mobile Broadband Interface Model	
166		November 14, 2011

The MBIM\_SMS\_FLAG\_NEW\_MESSAGE flag is set as soon as there are new (unread) messages in the message store, even if the messages arrived before the MBIM session between host and function was opened.

Notifications of MBIM\_CID\_SMS\_MESSAGE\_STORE\_STATUS are sent each time a new non-Class 0 SMS arrives even if there were already new (unread) messages. Notifications are not sent when all new messages have been read and the MBIM\_SMS\_FLAG\_NEW\_MESSAGE flag is unset.

Notification that the message store is full is sent as soon as this happens. No notification is sent when the store stops being full.

# **10.5.19.2 PARAMETERS**

See Table 10-99:

#### 10.5.19.7 STATUS CODES

Status code	Description
MBIM_STATUS_MEMORY_FAILURE	The operation failed because the because of device or SIM memory failure.

# 10.5.20 MBIM\_CID\_IP\_CONFIGURATION

#### **10.5.20.1 DESCRIPTION**

Sometimes, some or all of the IP configuration information is obtained as part of the procedure in which the link-layer for data services is established. In such cases, the MBIM function acquires IP configuration information from the carrier network on behalf of the host. This CID is used to transfer such IP configuration information from an MBIM function to the host.

It is also possible for some or all of the IP configuration information to be acquired by the host's IP stack interacting directly at or above the IP layer with the carrier network. In this case, the MBIM function does not participate in the acquisition of IP configuration information other than enabling basic IP packet service.

Thus, the two alternatives are:

- The MBIM function obtains IP configuration information on behalf of the host from the carrier network (more common for IPv4).
- The host's IP stack obtains IP configuration information from the carrier network (more common for IPv6).

It is also possible to obtain some IP configuration information via the MBIM function, and some other via the host's IP stack. In particular, some deployments of IPv6 may still rely on the MBIM function to

	Mobile Broadband Interface Model	
168		November 14, 2011

obtain the DNS information, while relying on the host's IP stack to acquire the other elements of IP configuration information.

An MBIM function indicates which IP configuration information it has obtained for IPv4 and IPv6 by setting appropriately these 2 bitmap fields in Table 10-105: MBIM IP CONFIGURATION INFO:

- IPv4ConfigurationAvailable
- IPv6ConfigurationAvailable

For each of the IP configuration elements (IP address element, gateway, MTU, etc), the corresponding bit indicates the following:

- Bit value is 0 ("information not available"): The function does not participate in obtaining the corresponding IP configuration element.
  - The function sets the corresponding field to 0 so the host can ignore it.
  - Typically, this implies that the host invokes mechanisms such as routing advertisements (in IPv6) and DHCP (for v4 or v6) in order to obtain the IP configuration element in question.
- Bit value is 1 ("information available"): The function has obtained the corresponding IP configuration element. This may mean that the host is to either set or delete the corresponding IP configuration information.
  - o The host does not ignore this information.
  - o If the element has a valid (non-zero) value, the host uses this value. All values of the corresponding element are set (e.g., if a new DNS server is obtained, the complete list is sent rather than just the newly acquired DNS server info).
  - o If the value of the element is zero, the host deletes the corresponding information. There is no selective deletion. All values of the corresponding element are deleted (e.g., all DNS servers if the bit in question corresponds to DNS server information).
  - o In the case of both MBIM\_IPV4\_ELEMENTand MBIM\_IPV6\_ELEMENT, the value of the element being zero means that both fields in those structures (OnLinkPrefixLength and IPv4 or IPv6 Address) are set to 0. Both fields in these structures are treated atomically, that is, they are either both being set (in which case both have valid non-zero values) or both are being deleted (in which case both have values of zero).

Even though this mechanism allows each IP configuration element to be configured either by the MBIM function or by the host, in the interest of simplicity this flexibility is constrained. For the purposes of this constraint, the IP configuration elements for either IPv4 or IPv6 are of two types:

- DNS server information
- Basic IP information (address, gateway or MTU)

#### Mobile Broadband Interface Model

The values for the elements in the Basic IP information group must be obtained the same way: either all by the MBIM function or all by the host's IP stack. In other words, the bits for Basic IP information in the IPv4ConfigurationAvailable or IPv6ConfigurationAvailable bitmaps in Table 10-105:

MBIM\_IP\_CONFIGURATION\_INFO (bits 0, 1 and 3) must all be set to the same value. The bit for the DNS server information (bit 2) may be set independently. Furthermore, for the duration of an IP data stream session, the bits in the IPv4ConfigurationAvailable and IPv6ConfigurationAvailable bitmaps must not change. In other words, the values for any given IP Configuration element, are obtained either the MBIM function or via the host's IP stack and this does not change during the duration of an IP data stream session.

### Query:

For **Query**, the InformationBuffer contains an MBIM\_IP\_CONFIGURATION\_INFO in which the only relevant field is the SessionId. The SessionId in a **Query** indicates which IP data stream's configuration information is to be returned by the function. InformationBuffer of MBIM\_COMMAND\_DONE contains an MBIM\_IP\_CONFIGURATION\_INFO.

#### **Unsolicited Event:**

**Unsolicited Event** InformationBuffer contains MBIM\_IP\_CONFIGURATION\_INFO. Whenever the MBIM function obtains updated IP configuration information, it must issue an **Unsolicited Event** to inform the host about the new value(s).

# Mobile Broadband Interface Model

For actual IP address data the IPv4 address will be 4 bytes in size and the IPv6 addresses will be 16 bytes in size. The addresses will be in network byte order (Big Endian).

#### **10.5.20.6 NOTIFICATION**

See Table 10-105: MBIM\_IP\_CONFIGURATION\_INFO.

#### 10.5.20.7 STATUS CODES

Status code	Description
MBIM_STATUS_CONTEXT_NOT_ACTIVATED	The operation failed because no context is currently activated.
	detivatedi

#### 10.5.21 MBIM\_CID\_USSD

#### **10.5.21.1 DESCRIPTION**

This CID is used to control the Unstructured Supplementary Service Data (USSD) according to 3GPP TS 22.090 [3GPP22090]. The command targets GSM-based devices and does not have to be supported by CDMA-based devices. Multi-mode functions currently operating in CDMA mode must fail USSD operations.

The command supports Set requests and Unsolicited Events. Query requests are not supported.

#### Set:

The command requires that SIM access and network access is available. The **Set** command shall include MBIM\_SET\_USSD as InformationBuffer. MBIM\_SET\_USSD includes MBIM\_USSD\_ACTION which can be used to initiate a new USSD session or continue the existing session, or to cancel an ongoing session. In case MBIM\_SET\_USSD is used to initiate or continue a session, the field USSDPayload in MBIM\_SET\_USSD includes the USSD data. This data is not a string as defined in section 10.4. Instead, it is data formatted per 3GPP TS 22.090 [3GPP22090]. If a session is canceled, the field USSDPayloadLength is set to 0 and the content of the field USSDPayload is undefined.

When a USSD command is completed the InformationBuffer of the response includes MBIM\_USSD\_INFO.

#### **Unsolicited Event:**

MBIM\_USSD\_INFO can also be sent unsolicited when a USSD session is initiated by the network.

MBIM\_USSD\_INFO includes a response code from the network and also the USSD string from the network if applicable. When a USSD command to cancel a session is completed, the response is of type MBIMUSSDTerminated.

	Mobile Broadband Interface Model	
174		November 14 2011

A USSD session is active until it is cancelled by sending a USSD command with action MBIMUSSDCancel, or until a complete command with MBIM\_USSD\_RESPONSE code not equal to MBIMUSSDActionRequired is received. Only one USSD session can exist at a time.

#### 10.5.21.7 STATUS CODES

Status code	Description
MBIM_STATUS_NOT_REGISTERED	The USSD operation failed because the device is not registered with any network.
MBIM_STATUS_INVALID_PARAMETERS	The USSD operation failed because of invalid parameters.

## 10.5.22 MBIM\_CID\_PHONEBOOK\_CONFIGURATION

#### 10.5.22.1 DESCRIPTION

This CID is used to retrieve information of the device phonebook. The command supports both GSM-and CDMA-based devices.

### Query:

The InformationBuffer for the **Query** command is empty. The completed command returns the MBIM\_PHONEBOOK\_CONFIGURATION\_INFO structure. A multi-mode single carrier function must provide access to the SIM phonebook even when operating in CDMA mode.

## **Unsolicited Notification:**

**Unsolicited Notifications** contains the MBIM\_PHONEBOOK\_CONFIGURATION\_INFO and are sent at two occasions; whenever there is a change in the phonebook state and when the phonebook becomes full, meaning that TotalNbrOfEntries equals UsedEntries in MBIM\_PHONEBOOK\_CONFIGURATION\_INFO. An unsolicited event shall not be sent by the function after each successful write to the phonebook.

The MaxNumberLength and MaxNameLength fields of the MBIM\_PHONEBOOK\_CONFIGURATION\_INFO structure report the maximum number of bytes for the phone number and for the contact name in a phonebook entry respectively. How many bytes are needed for a phonebook field does, however, depend on which characters are used. See GSM 11.11 specification [3GPP1111] for details of how the characters may be coded.

#### **10.5.22.7 STATUS CODES**

Status code	Description
MBIM_STATUS_NO_PHONEBOOK	There is no phonebook storage currently available (e.g., no phonebook available in SIM card)
MBIM_STATUS_PIN_REQUIRED	A PIN code restricts access to information about the phonebook

## 10.5.23 MBIM\_CID\_PHONEBOOK\_READ

#### **10.5.23.1 DESCRIPTION**

This CID is used to read one or all entries from the device phonebook.

## Query only:

Neither **Set** command nor **Unsolicited Event** is supported. The **Query** command includes MBIM\_PHONEBOOK\_READ\_REQ in InformationBuffer, which specifies if all phonebook entries or only a specific phonebook entry shall be read.

The complete command includes the MBIM\_PHONEBOOK\_READ\_INFO structure as InformationBuffer. The MBIM\_PHONEBOOK\_READ\_INFO includes an array of MBIM\_PHONEBOOK\_ENTRY structures, one for each entry being read.

## 10.5.23.4 QUERY

The following structure shall be used in the InformationBuffer

Table 10-118: MBIM\_PHONEBOOK\_READ\_REQ

Offset	Size	Field	Туре	Description
0	4	FilterFlag	MBIM_PHONEBOOK_FLAG	See Table 10-116:
				MBIM_PHONEBOOK_FLAG
4	4	FilterMessageIndex	UINT32	A value between 1 and
				TotalNbrOfEntries (see Table
				10-114:
				MBIM_PHONEBOOK_CONFIGURATI
				ON_INFO) that is an index into the
				device's phonebook store.
				This value in this member is valid
				only if FilterFlag is set to
				MBIMPhonebookFlagIndex. For all
				flags other than
				MBIMPhonebookFlagIndex, the Host
				sets this index to 0.

## 10.5.23.5 **RESPONSE**

The following structure shall be used in the InformationBuffer

Table 10-119: MBIM\_PHONEBOOK\_READ\_INFO

Offset	Size	Field	Туре	Description
0	4	ElementCount (EC)	UINT32	Number of phonebook entries
8	8*EC	PhoneBookRefList	OL_PAIR_LIST	First element of the pair is a 4 byte Offset in bytes, calculated from the beginning (offset 0) of this MBIM_PHONEBOOK_READ_INFO structure, to a Table 10-117: MBIM_PHONEBOOK_ENTRY.  The second element of the pair is a 4 byte size of the record element.

	Mobile Broadband Interface Model	
182		November 14, 2011

4+8*EC	DataBuffer	DATABUFFER	Array of phonebook entries, each	
			specified as in Table 10-117:	
			MBIM_PHONEBOOK_ENTRY.	

#### 10.5.23.6 STATUS CODES

Status code	Description
MBIM_STATUS_NOT_INITIALIZED	The device has not finished initializing the phonebook storage and is not able to read the phonebook.
MBIM_STATUS_NO_PHONEBOOK	There is no phonebook storage currently available (e.g. no phonebook available in SIM card)
MBIM_STATUS_PIN_REQUIRED	A PIN code restricts access to information about the phonebook
MBIM_STATUS_INVALID_MEMORY_INDEX	The index specified in the query command is either empty or not available in the phonebook
MBIM_STATUS_FILTER_NOT_SUPPORTED	The filter selected in the query command is not supported by the device
MBIM_STATUS_MEMORY_FAILURE	The command failed due to an error in the phonebook storage memory

#### 10.5.24 MBIM\_CID\_PHONEBOOK\_DELETE

#### **10.5.24.1 DESCRIPTION**

This CID is used to delete one or all entries in the device phonebook.

## Set only:

Neither **Query** command nor **Unsolicited Event** is supported. The **Set** command includes MBIM\_SET\_PHONEBOOK\_DELETE in InformationBuffer, which specifies if all phonebook entries or only a specific phonebook entry shall be deleted.

The complete command has no data in InformationBuffer only success or failure information will be included.

N	Nobile Broadband Interface Model

Table 10-120: Parameters

	Set	Query	Notification
Command	MBIM_SET_PHONEBOOK_DELETE	NA	NA
Response	Empty	NA	NA

#### 10.5.24.3 SET

The following structure shall be used in the InformationBuffer

Table 10-121: MBIM\_SET\_PHONEBOOK\_DELETE

Offset	Size	Field	Туре	Description
0	4	FilterFlag	MBIM_PHONEBOOK_FL AG	SeeTable 10-116: MBIM PHONEBOOK FLAG.
			AG	WBIWI_I HONEBOOK_I EAG.
4	4	FilterMessageIn dex	UINT32	A value between 1 and TotalNbrOfEntries (see Table 10-114:  MBIM_PHONEBOOK_CONFIGURATION_IN FO) that is an index into the device's phonebook store.  This value in this member is valid only if FilterFlag is set to  MBIMPhonebookFlagIndex. For all flags other than MBIMPhonebookFlagIndex, the Host sets this index to 0.

## 10.5.24.4 **RESPONSE**

The InformationBuffer shall be null and InformationBufferLength shall be zero

## **10.5.24.5 STATUS CODES**

Status code	Description
MBIM_STATUS_NOT_INITIALIZED	The device has not finished initializing the
	phonebook storage and is not able to delete
	phonebook entries.
MBIM_STATUS_NO_PHONEBOOK	There is no phonebook storage currently available
	(e.g. no phonebook available in SIM card)
MBIM_STATUS_PIN_REQUIRED	A PIN code needs to be entered before

	Mobile Broadband Interface Model	
184		November 14, 2011

	phonebook entries can be deleted.
MBIM_STATUS_INVALID_MEMORY_INDEX	The index specified in the query command is
	either empty or not available in the phonebook
MBIM_STATUS_FILTER_NOT_SUPPORTED	The filter selected in the query command is not
	supported by the device
MBIM_STATUS_MEMORY_FAILURE	The command failed due to an error in the
	phonebook storage memory

#### 10.5.25 MBIM\_CID\_PHONEBOOK\_WRITE

#### **10.5.25.1 DESCRIPTION**

This CID is used to write an entry to the device phonebook.

## Set only:

Neither **Query** command nor **Unsolicited Event** is supported. The **Set** command includes MBIM\_SET\_PHONEBOOK\_WRITE in InformationBuffer, which can be used to specify if the phonebook entry shall be saved to a specific location or if the first unused location shall be used.

The CID can also be used to change an existing phonebook entry by specifying an already used location to save the new entry.

The complete command has no data in InformationBuffer; only success or failure information is provided.

#### **10.5.25.2 PARAMETERS**

Table 10-122: Parameters

				N_INFO
24		DataBuffer	DATABUFFER	PhoneNumber,
				Name

## **10.5.25.5 RESPONSE**

The InformationBuffer shall be null and InformationBufferLength shall be zero

## **10.5.25.6 STATUS CODES**

Status code	Description
MBIM_STATUS_NOT_INITIALIZED	The device has not finished initializing the phonebook storage and is not able to write to the phonebook
MBIM_STATUS_NO_PHONEBOOK	There is no phonebook storage currently available (e.g. no phonebook available in SIM card)
MBIM_STATUS_PIN_REQUIRED	A PIN code restricts the command to be performed
MBIM_STATUS_INVALID_MEMORY_INDEX	The index specified in the set command is not available in the phonebook
MBIM_STATUS_FILTER_NOT_SUPPORTED	The SaveFlag selected in the set command is not supported by the device
MBIM_STATUS_MEMORY_FAILURE	The command failed due to an error in the phonebook storage memory
MBIM_STATUS_MEMORY_FULL	The set command could not be completed since there is no unused phonebook entry

Mobile Broadband Interface Model	
MODIE DIGADANA INICITACE MODE	

MBIM_STATUS_PARAMETER_TOO_LONG	One or several of the parameters in the set
	command was/were too long to be stored in the
	phonebook

#### 10.5.26 MBIM\_CID\_STK\_PAC

#### **10.5.26.1 DESCRIPTION**

This CID is used to propagate proactive commands from the SIM card to the host. A proactive command is always triggered from the SIM card. A proactive command may be handled in four different ways:

- The proactive command is handled by the function without notifying the host
- The proactive command is handled by the function with a notification sent to the host, e.g. to generate a message to the end-user
- The proactive command is propagated to the host for handling
- The proactive command is not handled by either host or function

#### Query:

The Query command can be used to read the current setting of which commands are handled where.

The **Query** command includes no InformationBuffer. The complete response to the **Query** command includes the MBIM STK PAC INFO structure in the InformationBuffer.

#### Set:

The **Set** command can be used by the host to say which commands it would like to handle or receive notifications for.

The **Set** command includes the MBIM\_SET\_STK\_PAC structure in the InformationBuffer, which allows the host to specify which commands it would like to handle or receive notifications for. The function shall let the host handle/receive notifications for all commands that the host requests and that the function allows the host to handle/receive notifications for. Proactive commands that the host does not request to handle shall not be propagated to the host. The complete response to the **Set** command contains the MBIM\_STK\_PAC\_INFO structure, where the function specifies which proactive commands will be handled where after the set command has been processed.

#### **Unsolicited Event:**

Once a proactive command is sent from the SIM card that the function is configured to propagate to the host, an MBIM\_CID\_STK\_PAC notification will be sent by the function. The notification will include MBIM\_STK\_PAC structure in the InformationBuffer.

	Mobile Broadband Interface Model	
188		November 14 2011

Note that the length of the proactive command is the second parameter included for the proactive command and it is therefore not specified as a separate field in MBIM\_STK\_PAC.

Multi-mode devices currently operating in CDMA mode must fail STK operations.

#### **10.5.26.2 PARAMETERS**

## Table 10-125: Parameters

	Set	Query	Notification
Comm and	MBIM_SET_STK_PAC	Empty	NA
Respon se	MBIM_STK_PAC_INFO	MBIM_STK_PAC_INFO	MBIM_STK_PAC

#### 10.5.26.3 DATA STRUCTURES

## Table 10-126: MBIM\_STK\_PAC\_PROFILE

Types	Value	Description
MBIMSTKNotHandledByFunctionCannotBeHandledByHost	0	The command is not handled in the function and the function will not be able to forward the command to the host.
MBIMSTKNotHandledByFunctionMayBeHandledByHost	1	The command is not handled by function but may be handled by the host if the host request so with the set command
MBIMSTKHandledByFunctionOnlyTransparentToHost	2	The command is handled by function without informing the host. The function will not allow the host to handle the command or receive notifications of the command even if the host requests so.
MBIMSTKHandled By Function Notification To Host Possible	3	The command is handled by function without informing the host. However, if the host
Mobile Broadband Inter	rface M	

		requests to receive the command it will receive notifications.
MBIMSTKHandledByFunctionNotificationsToHostEnabled	4	The command is handled by function, but the function will also send a notification to the host when the SIM sends the command.
MBIMSTKHandledByFunctionCanBeOverriddenByHost	5	The command is currently handled by the function, but if the host requests to handle the command it will get full control of the command and no handling will be made in the function.
MBIMSTKHandledByHostFunctionNotAbleToHandle	6	The command will be forwarded to the host. If the host decides to not receive the command any longer the function will not handle the command.
MBIMSTKHandledByHostFunctionAbleToHandle	7	The command will be forwarded to the host. If the host decides to not receive the command any longer the function will handle the command.

# Table 10-127: MBIM\_STK\_PAC\_TYPE

Types	Value	Description
MBIMSTKProactiveCommand	0	The proactive command is a proactive command that the host is requested to handle
MBIMSTKNotification	1	The proactive command is handled by the function, but the host is notified that the SIM has sent the proactive command and may decide to e.g. indicate this to the end user

	Mobile Broadband Interface Model	
190		November 14, 2011

## 10.5.26.4 SET

The following structure shall be used in the InformationBuffer

Table 10-128: MBIM\_SET\_STK\_PAC

## 10.5.26.5 QUERY

The InformationBuffer shall be null and InformationBufferLength shall be zero

#### 10.5.26.6 **RESPONSE**

The following structure shall be used in the InformationBuffer

Table 10-129: MBIM\_STK\_PAC\_INFO

Offset	Size	Field	Type	Description
0	256	PacSupport	MBIM_STK_PAC_PROFILE[256]	256 bytes where each byte identifies the current support for a specific proactive command.  Byte A in the string tells the current support for proactive command A. The
	Mobile Broadband Interface Model			

	numbering of the commands will be
	according to the values associated with
	each command in [ETSITS102223900]
	for Type of Command coding in BER-TLV
	tags. I.e., byte 1 means the REFRESH
	command and byte 21 means DISPLAY
	TEXT.
	Each byte can have one of the values
	defined in Table 10-126:
	MBIM_STK_PAC_PROFILE. Bytes that
	correspond to values that are not
	associated with any Type of Command
	shall be set to 0.

## **10.5.26.7 NOTIFICATION**

The following structure shall be used in the InformationBuffer

Table 10-130: MBIM\_STK\_PAC

Offset	Size	Field	Туре	Description
0	4	РасТуре	MBIM_STK_PAC_TYPE	The type of the proactive command, values in Table 10-127:  MBIM_STK_PAC_TYPE possible to use.
4		DataBuffer	DATABUFFER	Proactive command in BER-TLV format, starting with the Proactive UICC Command Tag as defined in [ETSITS102223900].

# **10.5.26.8 STATUS CODES**

Status code	Description
MBIM_STATUS_NOT_INITIALIZED	The function has not finished initializing the UICC and the command cannot be completed

	Mobile Broadband Interface Model	
192		November 14, 2011

MBIM_STATUS_PIN_REQUIRED	A PIN code restricts the command to be
	performed

#### 10.5.27 MBIM\_CID\_STK\_TERMINAL\_RESPONSE

#### **10.5.27.1 DESCRIPTION**

This CID is used to send a terminal response to a proactive command.

#### Set only:

Neither **Query** command nor **Unsolicited Event** is supported. The **Set** command includes the MBIM\_SET\_STK\_TERMINAL\_RESPONSE structure.

Compared to the proactive command, the terminal response as defined in [ETSITS102223900] does not specify the length of the response and the response length is therefore included as a specific field in MBIM\_SET\_STK\_TERMINAL\_RESPONSE.

The complete response includes the Table 10-133: MBIM\_STK\_TERMINAL\_RESPONSE\_INFO structure in the InformationBuffer, which contains the response APDU structure to the terminal response. This information can be used to see if the UICC response included any warning or error messages. Note that MBIM\_CID\_STK\_TERMINAL\_RESPONSE will be completed with MBIM\_STATUS\_SUCCESS also in cases the response APDU structure includes errors or warnings. The MBIM\_STATUS\_SUCCESS is not used when it was not possible to send the terminal response to the UICC.

## **10.5.27.2 PARAMETERS**

0	4	ResultDataStringOffset	OFFSET	Offset in bytes, calculated from the beginning of this structure, to a APDU response data string. See [ETSITS102223900].
4	4	ResultLength	SIZE	Length of the APDU response data string.
8	4	StatusWords	UINT32	Status words SW1 and SW2 in the APDU response structure. Coded as 0xAABB if SW1=AA and SW2=BB. See [ETSITS102223900].
12		DataBuffer	DATABUFFER	ResultDataString

## **10.5.27.6 STATUS CODES**

Status code	Description
MBIM_STATUS_NOT_INITIALIZED	The function has not finished initializing the UICC and the command cannot be completed

	Mobile Broadband Interface Model	
194		November 14, 2011

MBIM_STATUS_PIN_REQUIRED	A PIN code restricts the command to be	
	performed	
MBIM_STATUS_OPERATION_NOT_ALLOWED	The function does not allow the terminal response	
	to be sent to the UICC, e.g. due to that no	
	terminal response is expected	

#### 10.5.28 MBIM CID STK ENVELOPE

#### 10.5.28.1 DESCRIPTION

This CID is used to send an envelope command from the host to the SIM card.

#### Query:

The **Query** command can be used to retrieve which envelope commands the function expects the host to send to the SIM card and which envelope commands the function will generate on its own.

The response to the **Query** command includes MBIM\_STK\_ENVELOPE\_INFO as InformationBuffer.

## Set:

The **Set** command includes as MBIM\_SET\_STK\_ENVELOPE InformationBuffer. The response to the **Set** command does not include any InformationBuffer (the reaction to an envelope command can be a proactive command from the SIM card).

#### **10.5.28.2 PARAMETERS**

#### Table 10-134: Parameters

	Set	Query	Notifica
			tion
Comm	MBIM_SET_STK_ENVELOPE	Empty	NA
and			
Respon	Empty	MBIM_STK_ENVELOPE_INFO	NA
se			

#### 10.5.28.3 SET

The following structure shall be used in the InformationBuffer

Mobi	e Broadband Interface Model

Table 10-135: MBIM\_SET\_STK\_ENVELOPE

Offset	Size	Field	Туре	Description
0		DataBuffer	DATABUFFER	EnvelopeCommand: Envelope command in BER-TLV format, starting with a tag that specifies which envelope command is being sent. The tag values are defined in [ETSITS102220920]. The format of the envelope commands are defined in [ETSITS102223900].

## 10.5.28.4 QUERY

196

The InformationBuffer shall be null and InformationBufferLength shall be zero

## 10.5.28.5 **RESPONSE**

The following structure shall be used in the InformationBuffer

Table 10-136: MBIM\_STK\_ENVELOPE\_INFO

if a spect expect Hosts is common not expect the spect that in corresponding is expected by the specific property of the	tes where each bit indicates ecific envelope command is ted to be sent by the host. must not send envelope ands that the function does pect it to send.  In the field indicates if the ponding envelope command ected to be handled by the r not. If the bit is 1 the host ected to send the command; 0, it is not. The commands imbered according to the associated with each ope command in \$102223900]. The numbers atted with each envelope and are specified in

Mobile Broadband Interface Model

November 14, 2011

		[ETSITS102220920]. For example,
		bit 0xD3 means the Menu
		Selection, and bit 0xD7 means
		Timer Expiration. The bits are
		numbered so the least-significant
		bit is numbered 0.

#### **10.5.28.6 STATUS CODES**

Status code	Description
MBIM_STATUS_NOT_INITIALIZED	The function has not finished initializing the UICC and the command cannot be completed
MBIM_STATUS_PIN_REQUIRED	A PIN code restricts the command to be performed
MBIM_STATUS_OPERATION_NOT_ALLOWED	The function does not allow the terminal response to be sent to the UICC, e.g. due to that function sends the used envelope command itself

## 10.5.29 MBIM\_CID\_DEVICE\_SERVICES

#### **10.5.29.1 DESCRIPTION**

This CID is used to query the device services supported by the MBIM devices and their properties.

## Query only:

The MBIM\_DEVICE\_SERVICES\_INFO structure will be filled out by the device along with the appropriate number of MBIM\_DEVICE\_SERVICE\_ELEMENTs and returned to the host in the InformationBuffer of the CID request.

#### **10.5.29.2 PARAMETERS**

## Table 10-137: Parameters

	Set	Query	Notification

Mobile Broadband Interface Model

Command	NA	Empty	NA
Response	NA	MBIM_DEVICE_SERVICES_INFO	NA

## 10.5.29.3 DATA STRUCTURES

# Table 10-138: MBIM\_DEVICE\_SERVICE\_ELEMENT

Offset	Size	Field	Туре	Description
0	16	DeviceServiceId	UUID	A 16 byte UUID that identifies the device service.
16	4	DssPayload	UINT32	Bit 0: Indicates that DSS payload is supported from the host to the device for this device service.  Bit 1: Indicates that DSS payload is supported to the host from the device for this device service.  Unset: DSS payload not supported for this device service service.
20	4	MaxDssInstances	UINT32	Max amount of instances of this service, which device can handle (support).
24	4	CidCount	UINT32	Number of CIDs supported for this device service.

	Mobile Broadband Interface Model	
198		November 14, 2011

28	DataBuffer	DATABUFFER	CidList: List of CIDs
			supported for this device
			service. There must be
			CID Count number of
			entries in this list. Each
			CID is of type UINT32
			per Table 9-6:
			MBIM_COMMAND_MSG
			Message.

## 10.5.29.4 QUERY

The InformationBuffer shall be null and InformationBufferLength shall be zero

#### 10.5.29.5 **RESPONSE**

The following structure shall be used in the InformationBuffer

Table 10-139: MBIM\_DEVICE\_SERVICES\_INFO

Offset	Size	Field	Туре	Description
0	4	DeviceServicesCount (DSC)	UINT32	Number of  MBIM_DEVICE_SERVICE_ELEME  NT structures that follow in the  DataBuffer. Each device service supported by the device must have a separate  MBIM_DEVICE_SERVICE_ELEME  NT entry
4	4	MaxDssSessions	UINT32	The maximum number of activated Device Service Stream sessions that are supported by the function. The protocol allows up to 256 simultaneous DSS sessions. See Section 7 on Data Transport.

Mobile Broadband Interface Model

8	8*DSC	DeviceServicesRefList	OL_PAIR_LIST	The first element of the pair is a 4 byte Offset in bytes, calculated from the beginning (offset 0) of this  MBIM_DEVICE_SERVICES_INFO structure, to an  MBIM_DEVICE_SERVICE_ELEME  NT structure (see Table 10-138:  MBIM_DEVICE_SERVICE_ELEME  NT).  The second element of the pair is a 4 byte size of the corresponding  MBIM_DEVICE_SERVICE_ELEME  NT structure.
8+8*DSC		DataBuffer	DATABUFFER	Array of  MBIM_DEVICE_SERVICE_ELEME  NT structures.

#### 10.5.29.6 STATUS CODES

This CID only uses Generic Status Codes (see Use of the Status Codes section 9.4.5).

## 10.5.30 MBIM\_CID\_DEVICE\_SERVICE\_SUBSCRIBE\_LIST

#### **10.5.30.1 DESCRIPTION**

The host uses this CID to inform the function of the CIDs for which the host wishes to receive unsolicited events via MBIM\_INDICATE\_STATUS\_MESSAGE. As a result, the function must only indicate notifications for CIDs which have been enabled via this CID. The host updates this list appropriately as its state changes. State changes at the host are possibly triggered by events received from the function (including "wake up" from dormant states). Upon re-enabling suppressed notifications the host is responsible for synchronizing to the latest device state by performing queries for those CIDs.

Upon OPEN\_DONE completion, notifications for CIDs defined in this specification are enabled (aka subscribed to) by default, and vendor extension notifications are off by default.

#### Set only:

	Mobile Broadband Interface Model	
200		November 14, 2011

The **Set** command and its complete response include an MBIM\_DEVICE\_SERVICE\_SUBSCRIBE\_LIST structure.

#### **10.5.30.2 PARAMETERS**

#### **10.5.30.6 STATUS CODES**

Status code	Description
MBIM_STATUS_INVALID_DEVICE_SERVICE _OPERATION	The operation is invalid

## 10.5.31 MBIM\_CID\_AKA\_AUTH

## **10.5.31.1 DESCRIPTION**

This CID is used to send an authentication challenge to the device. The device must use the AKA (as opposed to AKA') 3rd generation Authentication and Key Agreement mechanism, specified for Universal Mobile Telecommunications System (UMTS) in [TS33.102] and for CDMA2000 in [S.S0055-A] for generating and indicating a response.

Multi-mode functions must support access to the SIM for authentication when operating in CDMA mode.

	Mobile Broadband Interface Model	
202		November 14, 2011

## Query only:

The structure for the **Query** is MBIM\_AKA\_AUTH\_REQ and the structure for the response is MBIM\_AKA\_AUTH\_INFO.

#### **10.5.31.2 PARAMETERS**

## Table 10-143: Parameters

	Set	Query	Notification
Command	NA	MBIM_AKA_AUTH_REQ	NA
Response	NA	MBIM_AKA_AUTH_INFO	NA

#### 10.5.31.3 QUERY

The following structure shall be used in the InformationBuffer

## Table 10-144: MBIM\_AKA\_AUTH\_REQ

Offset	Size	Field	Type	Description
0	16	Rand	UINT8[16]	Random number challenge of 128 bit.
16	16	Autn	UINT8[16]	AUTN is an authentication value generated by the AuC, which, together with the Rand, authenticates the server to the peer, 128 bits.

#### 10.5.31.4 RESPONSE

The following structure shall be used in the InformationBuffer

## Table 10-145: MBIM\_AKA\_AUTH\_INFO

Of	fset	Size	Field	Туре	Description
----	------	------	-------	------	-------------

0	16	Res	UINT8[16]	Authentication result from the peer, which, together with the Rand, authenticates the peer to the server, 128 bits. This is valid only in case of success.
16	4	ResLen	UINT32	Response Length
20	16	IK	UINT8[16]	Integrating key. This is valid only in case of success.
36	16	СК	UINT8[16]	Ciphering key. This is valid only in case of success.
52	14	Auts	UINT8[14]	A value generated by the peer upon experiencing a synchronization failure, 112 bits. This is valid only in case of failure.

## **10.5.31.5 STATUS CODES**

Status code	Description
MBIM_STATUS_AUTH_INCORRECT_AUTN	The device sets this error on an AKA or AKAPrime challenge response when the AKA or AKAPrime challenge sent has incorrect AUTN.
MBIM_STATUS_AUTH_SYNC_FAILURE	The device sets this error on an AKA or AKAPrime challenge response when the AKA or AKAPrime challenge sent has synchronization failure. When this error code is returned the AUTS field would be set.
MBIM_STATUS_AUTH_AMF_NOT_SET	The device sets this error on an AKA or AKAPrime challenge response when the AKA or AKAPrime challenge sent does not have the AMF bit set to 1.

	Mobile Broadband Interface Model	
204		November 14, 2011

#### 10.5.32 MBIM\_CID\_AKAP\_AUTH

#### **10.5.32.1 DESCRIPTION**

This CID is used to send an authentication challenge to the device. The device must use the AKA' (as opposed to AKA) 3rd generation Authentication and Key Agreement mechanism, specified for Universal Mobile Telecommunications System (UMTS) in [TS33.102] and for CDMA2000 in [S.S0055-A] for generating and indicating a response.

Multi-mode functions must support access to the SIM for authentication when operating in CDMA mode.

## Query only:

The structure for the **Query** is MBIM\_AKAP\_AUTH\_REQ and the structure for the response is MBIM\_AKAP\_AUTH\_INFO

#### **10.5.32.2 PARAMETERS**

Table 10-146: Parameters

	Set	Query	Notification
Command	NA	MBIM_AKAP_AUTH_REQ	NA
Response	NA	MBIM_AKAP_AUTH_INFO	NA

## 10.5.32.3 QUERY

The following structure shall be used in the InformationBuffer

Table 10-147: MBIM\_AKAP\_AUTH\_REQ

Offset	Size	Field	Туре	Description
0	16	Rand	UINT8[16]	Random number challenge of 128 bits.
16	16	Autn	UINT8[16]	AUTN is an authentication value generated by the AuC, which, together with the Rand, authenticates the server to the peer, 128 bits.

32	4	NetworkNameOffset	OFFSET	Offset in bytes, calculated from the beginning of this
				structure, to a string NetworkName that represents the Name of the Access
				Network. See [RFC 4282].
36	4	NetworkNameLength	SIZE	Length of Name of Access Network.
40		DataBuffer	DATABUFFER	NetworkName

## 10.5.32.4 **RESPONSE**

The following structure shall be used in the InformationBuffer

Table 10-148: MBIM\_AKAP\_AUTH\_INFO

Offset	Size	Field	Туре	Description
0	16	Res	UINT8[16]	Authentication result from the peer, which, together with the Rand, authenticates the peer to the server, 128 bits. This is valid only in case of success.
16	4	ResLen	UINT32	Response Length
20	16	IK	UINT8[16]	Integrating key. This is valid only in case of success.
36	16	СК	UINT8[16]	Ciphering key. This is valid only in case of success.
52	14	Auts	UINT8[14]	A value generated by the peer upon experiencing a synchronization failure, 112 bits. This is valid only in case of failure.

	Mobile Broadband Interface Model	
206		November 14, 2011

#### **10.5.32.5 STATUS CODES**

Status code	Description
MBIM_STATUS_AUTH_INCORRECT_AUTN	The device sets this error on an AKA or AKAPrime challenge response when the AKA or AKAPrime challenge sent has incorrect AUTN.
MBIM_STATUS_AUTH_SYNC_FAILURE	The device sets this error on an AKA or AKAPrime challenge response when the AKA or AKAPrime challenge sent has synchronization failure. When this error code is returned the AUTS field would be set.
MBIM_STATUS_AUTH_AMF_NOT_SET	The device sets this error on an AKA or AKAPrime challenge response when the AKA or AKAPrime challenge sent does not have the AMF bit set to 1.

## 10.5.33 MBIM\_CID\_SIM\_AUTH

#### **10.5.33.1 DESCRIPTION**

This CID is used to send an authentication challenge to the device. The device must use the authentication mechanism that is based on the GSM authentication and key agreement primitives which is a 2nd generation mobile network standard

Multi-mode functions must support access to the SIM for authentication when operating in CDMA mode.

## Query only:

The structure for the Query is MBIM\_SIM\_AUTH\_REQ and the structure for the response is MBIM\_SIM\_AUTH\_INFO.

#### **10.5.33.2 PARAMETERS**

## 10.5.33.3 QUERY

The following structure shall be used in the InformationBuffer.

Table 10-150: MBIM\_SIM\_AUTH\_REQ

Offset	Size	Field	Туре	Description
0	16	Rand1	UINT8[16]	Random number challenge of 128 bit.
16	16	Rand2	UINT8[16]	Random number challenge of 128 bit.
32	16	Rand3	UINT8[16]	Random number challenge of 128 bit.
48	4	n	UINT32	number of random number challenges. "n" can be 2 or 3 per RFC 4186 [RFC 4186]. If n= 2, Rand1 and Rand2 should be used and if n=3, Rand1, Rand2 and Rand3 should be used

## 10.5.33.4 RESPONSE

The following structure shall be used in the InformationBuffer

Table 10-151: MBIM\_SIM\_AUTH\_INFO

Offset	Size	Field	Туре	Description
0	4	Sres1	UINT32	Response1 of 32 bit.
4	8	Kc1	UINT64	Encryption key1 of 64 bit.
12	4	Sres2	UINT32	Response2 of 32 bit.
16	8	Kc2	UINT64	Encryption key2 of 64 bit.
24	4	Sres3	UINT32	Response3 of 32 bit.
28	8	Kc3	UINT64	Encryption key3 of 64 bit.

	Mobile Broadband Interface Model	
208		November 14 2011

36	4	n	UINT32	Number of responses. "n" can
				be 2 or 3 per RFC 4186 [RFC
				4186]. If n= 2, Sres1 and Sres
				2 should be used and if n=3,
				Sres1/Kc1, Sres2/Kc2 and
				Sres3/Kc3 should be used

## 10.5.33.5 STATUS CODES

This CID only uses Generic Status Codes (see Use of the Status Codes section 9.4.5).

#### 10.5.34 MBIM\_CID\_PACKET\_STATISTICS

#### **10.5.34.1 DESCRIPTION**

This command returns the packet statistics for all the Raw IP Data Streams kept by the device. These are IP packet statistics, unrelated to the underlying NTB transport used to transfer the IP packets. These statistics must be clear at initialization performed in MBIM\_OPEN\_DONE as a response to MBIM\_OPEN\_MSG (section 9.4.1).

Statistics are kept in two directions:

- "In": From the function to the host.
- "Out": From the host to the function.

#### Query only:

InformationBuffer of **Query** message is empty. InformationBuffer of MBIM\_COMMAND\_DONE contains MBIM\_PACKET\_STATISTICS\_INFO.

#### **10.5.34.2 PARAMETERS**

#### Table 10-152: Parameters

Command	NA	Empty	NA
Response	NA	MBIM_PACKET_STATISTICS_INFO	NA

Mobile Broadband Interface Model	

## 10.5.34.3 QUERY

The InformationBuffer shall be null and InformationBufferLength shall be zero

## 10.5.34.4 RESPONSE

The following structure shall be used in the InformationBuffer

Table 10-153: MBIM\_PACKET\_STATISTICS\_INFO

Offset	Size	Field	Туре	Description
0	4	InDiscards	UINT32	The number of inbound IP packets that have been discarded to free up memory resources (for example, due to flow control) or for other reasons not related to any error that would prevent their being sent to the host.
4	4	InErrors	UINT32	The number of inbound IP packets that have not been sent to the host because of errors.
8	8	InOctets	UINT64	The total number of raw IP bytes successfully sent to the host (not including any padding in NTB).
16	8	InPackets	UINT64	The number of IP packets successfully sent to the host.
24	8	OutOctets	UINT64	The total number of raw IP bytes successfully transmitted out of the function (not including any padding in NTB).
32	8	OutPackets	UINT64	The total number of raw IP packets successfully received by the function from the host.
40	4	OutErrors	UINT32	The number of outbound IP packets received by the function from the host that could not be delivered out of the function because of errors.
44	4	OutDiscards	UINT32	The number of outbound IP packets that have been discarded to free up memory resources (for example, due to flow control) or for other reasons not related to any error.

	Mobile Broadband Interface Model	
210		<b>November 14, 2011</b>

#### **10.5.34.5 STATUS CODES**

This CID only uses Generic Status Codes (see Use of the Status Codes section 9.4.5).

#### 10.5.35 MBIM CID NETWORK IDLE HINT

#### 10.5.35.1 **DESCRIPTION**

This CID is a network idle mode hint from the host to the function. The MBIM function can use this hint in its heuristics to enable mechanisms such as 'Fast Dormancy', and to faster enter low power modes in its network operations. The tradeoff, of course, is potentially longer latency. The host also uses its own heuristics to determine when to send this hint to the function, and may typically happen when the host estimates that for a period of time there will be a reduction in network traffic via this MBIM function, or if the host is entering some idle state.

#### **Set and Query:**

The **Query** command contains no InformationBuffer. The **Set** command and the MBIM\_COMMAND\_DONE (for both **Query** and **Set** requests) contain MBIM\_NETWORK\_IDLE\_HINT as InformationBuffer.

#### **10.5.35.2 PARAMETERS**

#### Table 10-154: Parameters

	Set	Query	Notifica
			tion
Comm	MBIM_NETWORK_IDLE_HINT	Empty	NA
and			
Respo	MBIM_NETWORK_IDLE_HINT	MBIM_NETWORK_IDLE_HINT	NA
nse			

## 10.5.35.3 DATA STRUCTURES

#### Table 10-155: MBIM\_NETWORK\_IDLE\_HINT\_STATES

Types	Value	Description
MBIMNetworkIdleHintDisabled	0	The current hint to the function is to not utilize mechanisms for entering lower power modes
		faster.

Mobile Broadband Interface Model	

MBIMNetworkIdleHintEnabled	1	The current hint to the function is to utilize
		mechanisms for entering lower power modes
		faster.

## 10.5.35.4 SET

The following structure shall be used in the InformationBuffer

Table 10-156: MBIM\_NETWORK\_IDLE\_HINT

Offset	Size	Field	Туре	Description
0	4	NetworkIdleHintState	MBIM_NETWOR K_IDLE_HINT_ST ATES	One of the values in Table 10-155:  MBIM_NETWORK_IDLE_HINT_STATES.  For Set requests the value represents the hint from the host to the function.
				For completions to Query and Set requests the value represents the hint the function is currently following.

#### 10.5.35.5 QUERY

The InformationBuffer shall be null and InformationBufferLength shall be zero

#### 10.5.35.6 RESPONSE

See Table 10-156: MBIM\_NETWORK\_IDLE\_HINT.

#### 10.5.35.7 STATUS CODES

This CID only uses Generic Status Codes (see Use of the Status Codes section 9.4.5).

## 10.5.36 MBIM\_CID\_EMERGENCY\_MODE

#### 10.5.36.1 **DESCRIPTION**

This CID returns information about an MBIM function's emergency mode state. This CID applies to functions that are capable of supporting emergency mode. Emergency mode could be over the traditional voice or over VoIP.

#### Query:

**Query** InformationBuffer contains MBIM\_EMERGENCY\_MODE\_INFO.

#### **Unsolicited Event:**

	Mobile Broadband Interface Model	
212		November 14, 2011

**Unsolicited Event** InformationBuffer contains MBIM\_EMERGENCY\_MODE\_INFO.

#### **10.5.36.2 PARAMETERS**

#### 10.5.36.3 DATA STRUCTURES

## Table 10-158: MBIM\_EMERGENCY\_MODE\_STATES

Types	Value	Description
MBIMEmergencyModeOff	0	Emergency service is not available.
MBIMEmergencyModeOn	1	Emergency service is available. Examples of emergency mode functions are calls to 112 in Europe or 911 in the US.

## 10.5.36.4 QUERY

The InformationBuffer shall be null and InformationBufferLength shall be zero

## 10.5.36.5 RESPONSE

The following structure shall be used in the InformationBuffer

## Table 10-159: MBIM\_EMERGENCY\_MODE\_INFO

Offset	Size	Field	Туре	Description

Mobile Broadband Interface Model

November 14, 2011 213

0	4	EmergencyMode	MBIM_EMERGENCY_	One of the values in Table 10-158:
			MODE_STATES	MBIM_EMERGENCY_MODE_STATES.
				This is the state of the device in terms of
				Emergency mode. Applicable to devices
				that are capable of supporting emergency
				mode. Emergency mode could be over the
				traditional voice or over VoIP.
				It is possible for devices to specify that they
				support emergency call services even in
				scenarios where they detect that the SIM is
				no longer valid. SIMs may become invalid
				for any of several reasons, e.g., the
				subscription is unpaid, or service has been
				deactivated because the device has been
				reported stolen.

#### **10.5.36.6 NOTIFICATION**

See Table 10-159: MBIM\_EMERGENCY\_MODE\_INFO

#### **10.5.36.7 STATUS CODES**

This CID only uses Generic Status Codes (see Use of the Status Codes section 9.4.5).

#### 10.5.37 MBIM\_CID\_IP\_PACKET\_FILTERS

#### **10.5.37.1 DESCRIPTION**

This command returns information about the list of packet filters and allows that list to be set. These packet filters apply exclusively to IP data stream sessions.

Some hosts are able to conserve energy and stay quiet in a "sleeping" state while not being used. USB Networking devices may provide special pattern filtering hardware that enables it to wake up the attached host on demand upon an attempt to contact the host (e.g., an incoming TCP connection).

NOTE: To enable remote wake-up, additional steps must be completed as described in [USB2.0].

If the host simply wishes to clear (remove) any previous filter for the specified SessionId, the value of PacketFiltersCount is set to Zero and no DataBuffer (pattern filter structure) follows.

Mobile Broadband Interface Model		
214		November 14, 2011

If the specified pattern is not able to fit into the device, any pattern previously loaded is considered destroyed, and the function must set MBIM\_STATUS\_SUCCESS and PacketFiltersCount to 0 in the MBIM\_PACKET\_FILTERS returned from the response.

Once the PacketFilters are set on a given SessionId, the function must match the Session's incoming packets to the specified filters. If there is a match, the function lets the packet through. If a packet does not match, it is discarded. If there are no PacketFilters set for a given SessionId, then the function allows all packets for that Session through.

NOTE: The use of packet filters can have a heavy impact on the performance of the device. Accordingly, packet filters are only recommended for use in low traffic scenarios. For firewall functionality it is recommended to use the host instead.

The host is in control of the packet filters by using this CID. It is expected that as the host changes state, it updates the set of filters to—for example—avoid being woken up due to non-essential traffic.

#### **Query and Set:**

Both **Query** and **Set** contain an MBIM\_PACKET\_FILTERS in its InformationBuffer. For **Query**, however, the only relevant field is the SessionId. The SessionId in a **Query** indicates which IP data stream's filters are to be returned by the device.

MBIM\_PACKET\_FILTERS is returned from both **Query** and **Set** complete messages in the InformationBuffer.

#### **10.5.37.2 PARAMETERS**

#### Table 10-160: Parameters

#### 10.5.37.3 DATA STRUCTURES

#### Table 10-161: MBIM\_SINGLE\_PACKET\_FILTER

Offset	Size	Field	Туре	Description

N	Nobile Broadband Interface Model

0	4	FilterSize	SIZE (0bMaxFilterSize)	Size in bytes of the PacketFilter field as well as the PacketMask field at the end of this structure.  This number must not exceed the value of bMaxFilterSize from Table 6-3: MBIM FUNCTIONAL DESCRIPTOR.
4	4	PacketFilterOffset	OFFSET	Offset in bytes, calculated from the beginning of this structure, to a PacketFilter of size FilterSize.  This is a string of bytes to perform pattern matching on, starting from the beginning of the IP packet (the Version field in an IPv4 or IPv6 header).
8	4	PacketMaskOffset	OFFSET	Offset in bytes, calculated from the beginning of this structure, to a PacketMask of size FilterSize.  Each byte of Mask contains 8 masking bits, where each one of them represents whether or not the associated bit (if it is equal to 1) of the PacketFilter should be compared with what is seen on the media by the function.
12		DataBuffer	DATABUFFER	PacketFilter PacketMask

Mobile Broadband Int	terface Model
----------------------	---------------

10.5.37.4 SET

The following structure shall be used in the InformationBuffer

Table 10-162: MBIM\_PACKET\_FILTERS

Offset	Size	Field	Туре	Description
0	4	SessionId	UINT32	Packet Filters are specified in a per- SessionId basis. Accordingly, filters must not be set prior to opening the relevant SessionId via MBIM_CID_CONNECT.
4	4	PacketFiltersCount (PFC)	UINT32	Number of Table 10-161:  MBIM_SINGLE_PACKET_FILTER structures that follow in the  DataBuffer. This number must not exceed the value of bNumberFilters from Table 6-3: MBIM FUNCTIONAL DESCRIPTOR.
8	8*PFC	PacketFilterRefList	OL_PAIR_LIST	The first element of the pair is a 4 byte Offset in bytes, calculated from the beginning (offset 0) of this MBIM_PACKET_FILTERS structure, to an MBIM_SINGLE_PACKET_FILTER structure (see Table 10-161: MBIM_SINGLE_PACKET_FILTER).  The second element of the pair is a 4 byte size of the corresponding MBIM_SINGLE_PACKET_FILTER structure.
8+8*PFC		DataBuffer	DATABUFFER	Array of  MBIM_SINGLE_PACKET_FILTER  structures.

Mobile	Broadband	Interface	Model

#### 10.5.37.5 **QUERY**

See **Set** and Table 10-162: MBIM\_PACKET\_FILTERS.

#### 10.5.37.6 **RESPONSE**

See **Set** and Table 10-162: MBIM\_PACKET\_FILTERS.

#### 10.5.37.7 STATUS CODES

This CID only uses Generic Status Codes (see Use of the Status Codes section 9.4.5).

#### 10.5.38 MBIM\_CID\_DSS\_CONNECT

#### **10.5.38.1 DESCRIPTION**

This CID activates and deactivates a data stream channel over the bulk pipe for a non-IP based Device Service.

This command can be called after a successful result of MBIM\_OPEN\_MSG.

Set operations are supported for this command.

The host might open several Device Service Streams up to the maximum number of sessions as specified in MaxDssSessions in Table 10-139: MBIM\_DEVICE\_SERVICES\_INFO (itself, in response to a MBIM\_CID\_DEVICE\_SERVICES per section 10.5.29).

The function may allow opening multiple instances of the same Device Service, if the value of MaxDssInstances in Table 10-138: MBIM DEVICE SERVICE ELEMENT is more than one.

If the function cannot open a new session due to instance limit, it shall reply with status code MBIM\_STATUS\_DSS\_INSTANCE\_LIMIT.

#### Set only:

**Set** operations are supported for this command. The InformationBuffer for the command contains an MBIM\_SET\_DSS\_CONNECT structure. The InformationBuffer in the response is empty.

#### **10.5.38.2 PARAMETERS**

#### Table 10-163: Parameters

	Set	Query	Notification
Command	MBIM_SET_DSS_CONNECT	NA	NA
Response	Empty	NA	NA

	Mobile Broadband Interface Model	
218		November 14 2011

## 10.5.38.3 DATA STRUCTURES

Table 10-164: MBIM\_DSS\_LINK\_STATE

Types	Value
MBIMDSSLinkDeactivate	0
MBIMDSSLinkActivate	1

#### 10.5.38.4 SET

The following structure shall be used in the InformationBuffer

## Table 10-165: MBIM\_SET\_DSS\_CONNECT

Offset	Size	Field	Туре	Description
0	16	DeviceServiceId	UUID	A 16 byte UUID that identifies the Device Service for provided DssSessionId.

16	4	DssSessionId	UINT32	Host specifies this member to uniquely identify the session for the Device Service Stream.  Device must use the value in this member when completing set requests. The Host uses the value in this member in subsequent query requests as well as close requests to the device. The value shall also be used as an identifier on the data transport.  The function can reject the request if the host uses a DssSessionId that exceeds MaxDssSessions-1, where MaxDssSessions is in Table 10-139: MBIM_DEVICE_SERVICES_INFO.  The host is using bits 7-0 of DssSessionId 4-byte value. Bits 31-8 are reserved and shall be zero.  Valid values range from 0 to MaxDssSessions -1.
20	4	DssLinkState	UINT32	SeeTable 10-164: MBIM_DSS_LINK_STATE

## 10.5.38.5 **RESPONSE**

The InformationBuffer shall be null and InformationBufferLength shall be zero

## **10.5.38.6 STATUS CODES**

Status code	Description
MBIM_STATUS_SUCCESS	The DSS is successfully opened
MBIM_STATUS_BUSY	If the function temporarily cannot open the DSS it shall return this error code
MBIM_STATUS_FAILURE	An unknown error where encountered during opening of the DSS.

	Mobile Broadband Interface Model	
220		November 14, 2011

MBIM_STATUS_DSS_INSTANCE_LIMIT	If the function cannot open a new session due to instance
	limit, it shall reply with this status code.

#### 10.5.39 MBIM\_CID\_MULTICARRIER\_PROVIDERS

#### **10.5.39.1 DESCRIPTION**

This command returns a list of network providers that are the preferred providers for a multi-carrier function. The CID is supported when the device reports support for MBIM\_CTRL\_CAPS\_\_MULTI\_CARRIER.

## **Set and Query:**

A provider is added to this list when a **Set** message is successfully completed on MBIM\_CID\_HOME\_PROVIDER. Previously added providers continue to be reported by the **Query** message. MBIM\_PROVIDERS is returned from both **Set** and **Query** complete messages in the InformationBuffer.

InformationBuffer of the **Query** message is empty. InformationBuffer of MBIM\_COMMAND\_DONE contains an MBIM\_PROVIDERS structure (see Table 10-39: MBIM\_PROVIDERS)

#### **Unsolicited Event:**

The InformationBuffer in the **Unsolicited Event** contains an MBIM\_PROVIDERS structure.

#### **10.5.39.2 PARAMETERS**

Table 10-166: Parameters

	Set	Query	Notification
Comma nd	MBIM_PROVIDERS	Empty	NA
Respon se	MBIM_PROVIDERS	MBIM_PROVIDERS	MBIM_PROVIDERS

#### 10.5.39.3 QUERY

The InformationBuffer shall be null and InformationBufferLength shall be zero

#### 10.5.39.4 **RESPONSE**

See Table 10-39: MBIM\_PROVIDERS

Mobile Broadband Interface Model	

#### **10.5.39.5 NOTIFICATION**

See Table 10-39: MBIM\_PROVIDERS

#### **10.5.39.6 STATUS CODES**

Status code	Description
MBIM_STATUS_READ_FAILURE	Reading information from the function failed.

## **10.6 MBIM SERVICE AND CID EXTENSIBILITY**

This specification targets only the basic functionality for a connectivity service, but the services and CIDs can easily be extended by creating a new MBIM service and matching UUID, and then registering them at the MBIM Registry [MBIMRegistry].

	Mobile Broadband Interface Model	
222		November 14, 2011

# 11 MBIM MANDATORY FUNCTIONALITY

## 11.1 MBIM MANDATORY BASIC MECHANISMS

Basic mechanisms are mandatory as specified in sections 4, 6, 7 and 9. Section 8 contains mandatory mechanisms as specified in Table 8-1: Networking Control Model Requests.

The mechanisms specified in section 3.2 are conditionally mandatory: they are mandatory only for NCM/MBIM functions.

## 11.2 MBIM MANDATORY COMMAND IDS

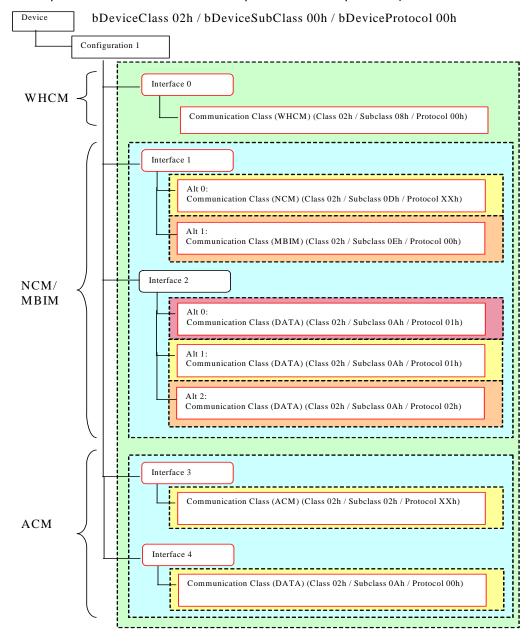

Not all of the Service and Command IDs are mandatory to implement. That bare minimum mandatory to implement functionality comprises the following CIDs from the Basic Connectivity Service:

- MBIM CID DEVICE CAPS
- MBIM\_CID\_SUBSCRIBER\_READY\_STATUS
- MBIM\_CID\_RADIO\_STATE
- MBIM CID PIN
- MBIM\_CID\_HOME\_PROVIDER
- MBIM\_CID\_REGISTER\_STATE
- MBIM\_CID\_SIGNAL\_STATE
- MBIM\_CID\_CONNECT
- MBIM\_CID\_IP\_CONFIGURATION
- MBIM CID DEVICE SERVICES
- MBIM CID PACKET SERVICE

All other services and their CIDs are optional.

# 12 APPENDIX: COMPATIBILITY WITH NCM 1.0 EXAMPLE

This is an example on how the descriptors could look like for a MBIM/NCM device. In this example there is also an additional ACM port (Abstract Control Model from [USBCDC12]) just to show how MBIM/NCM can work with other functions as well. (Note: Both instances of "XXh" in the diagram below are due to the fact that the protocol in those two cases is implementation-dependent.)
